Sun's 2003 Worldwide Java Developer Conference™

Orchestration, Choreography and Collaboration in Web Services and ebXML

Ron Ten-Hove

Staff Software Engineer
Sun Microsystems

Goals

Examine message sequencing in Web Services and Business Web Services

Ron Ten-Hove

- Staff Engineer, Sun Java™ Web Services Business Integration Product Development
 - Developed EAI Products for Forté Software (now part of Sun Microsystems)
 - EAI Web Services
 - ebXML BPSS
 - WSCI
 - JSR 208
- Et cetera

The next important area of development of Web Services is so-called Choreography. Many new concepts and specifications are emerging.

Agenda

- Definitions
- Abstract Models
- Web Services
- Business Web Services
- Summary

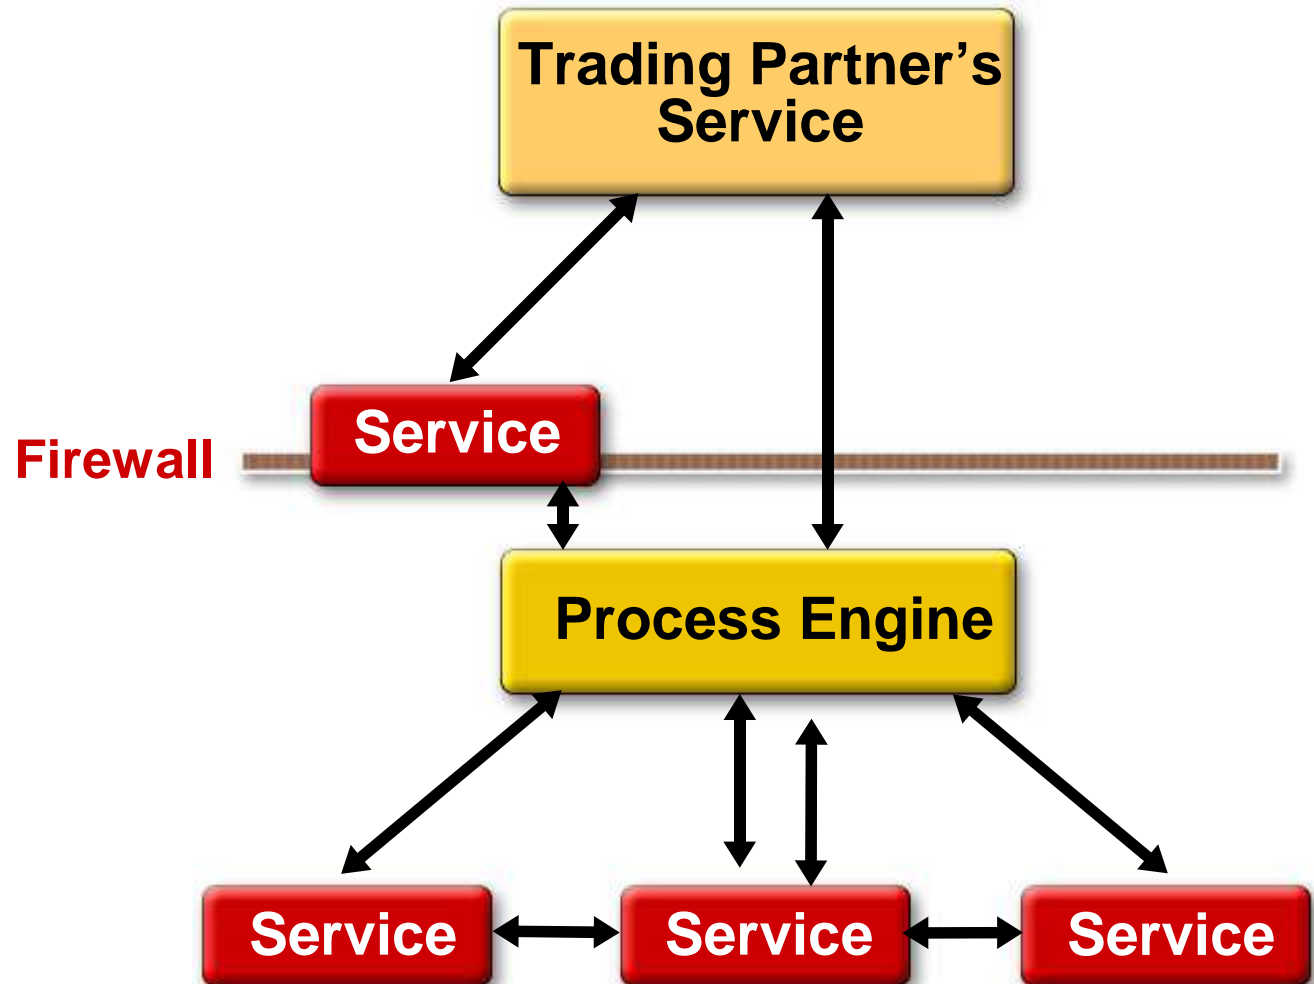

Service-Oriented Architecture (SOA)

- Services, Services Everywhere
- Business Processes:
 - Use Services
 - Provide Services
- Useful EAI Approach
- SOAP + WSDL = Web Services
- ebXML Business Web Services

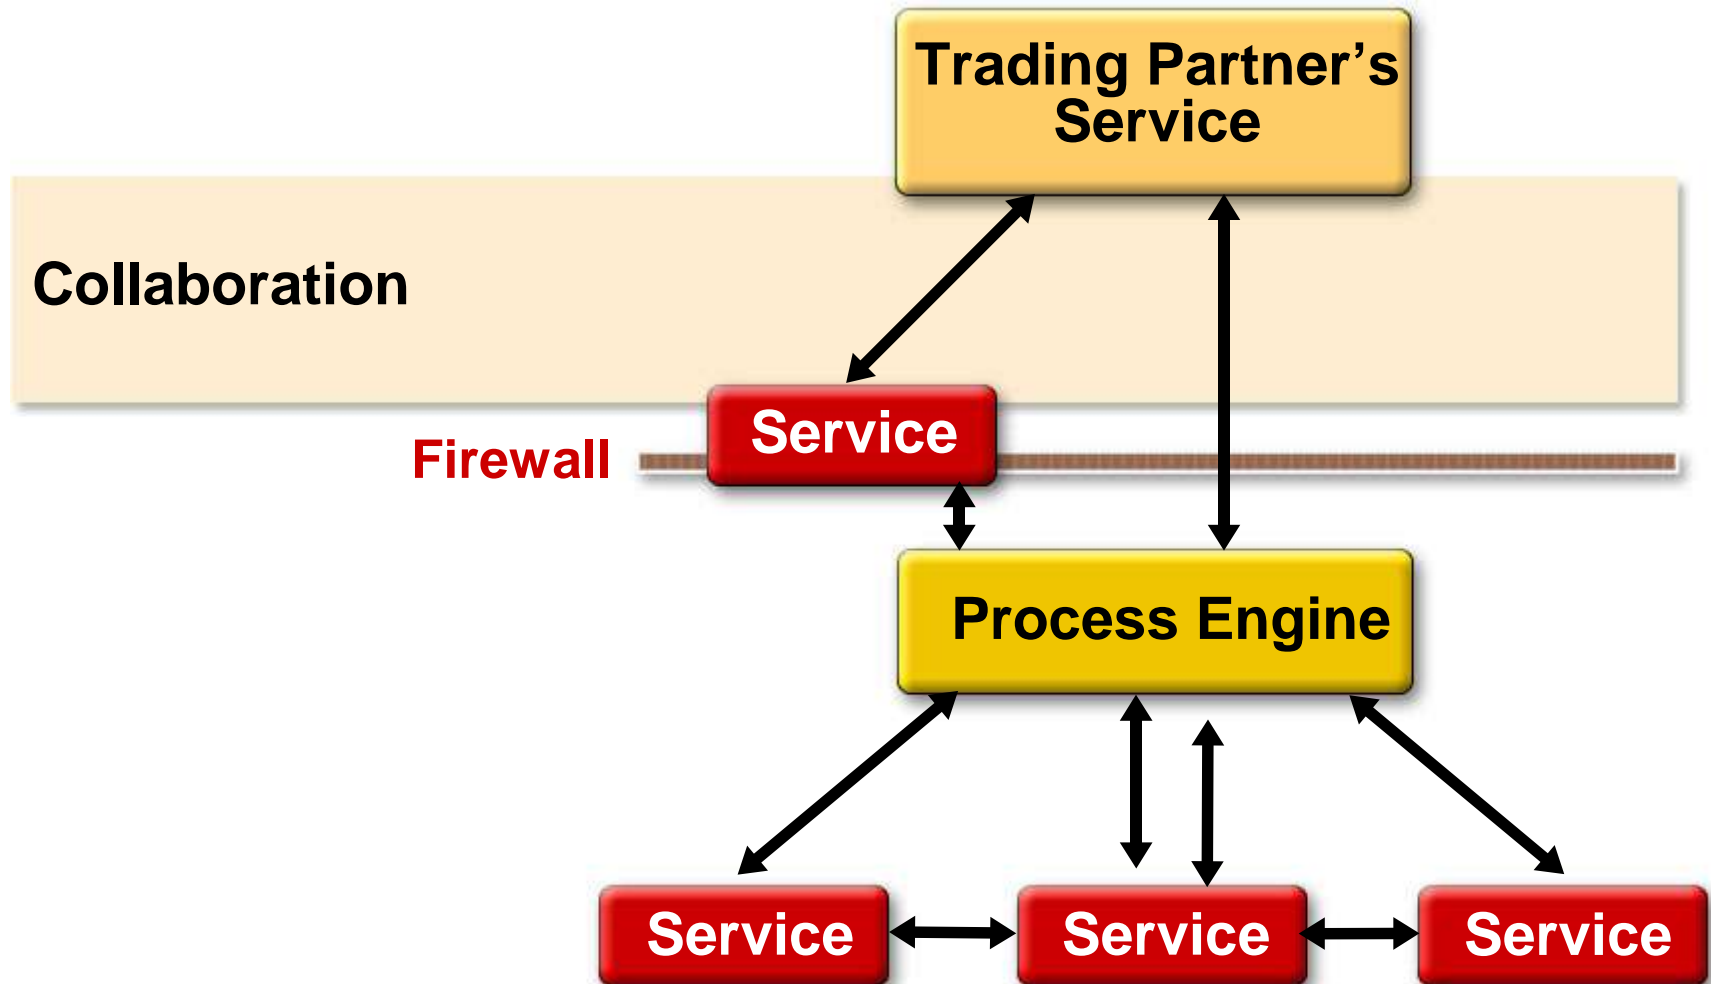

Some Terminology (WS Flavored)

- Collaboration
 - Two or more peers
 - Business-oriented goals
- Orchestration
 - Running business processes
- Choreography
 - Sequencing “interface”
 - Client/Server

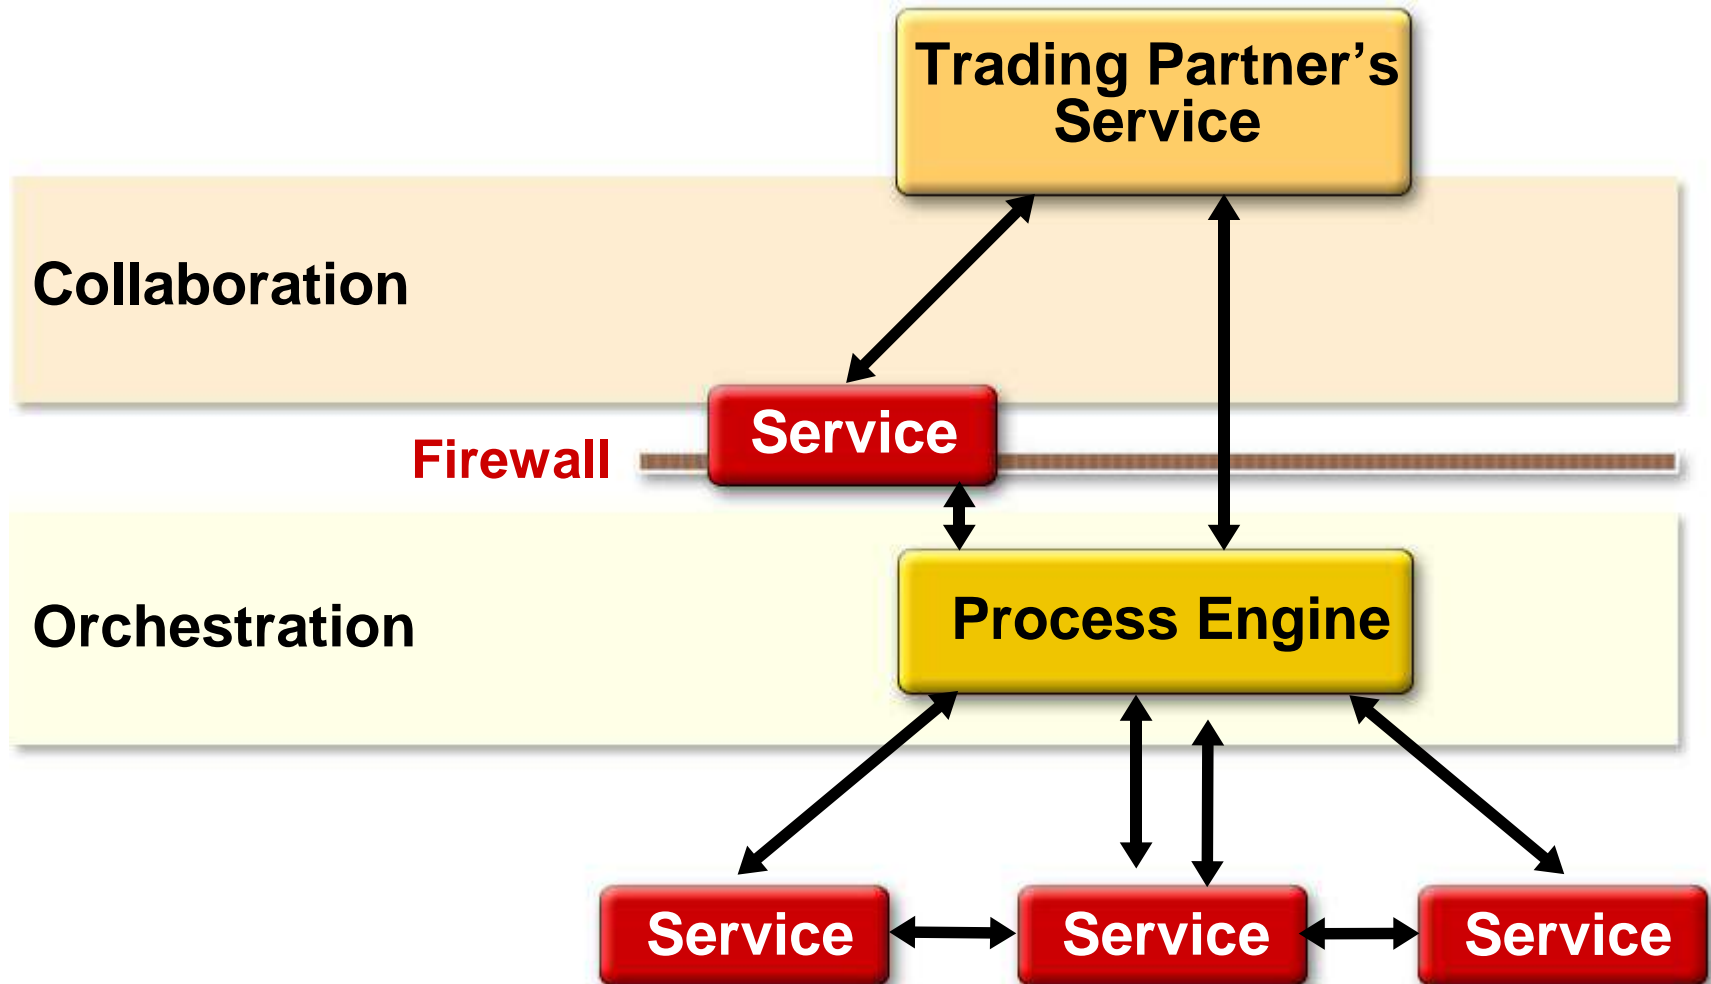

Definitions (Cont.)

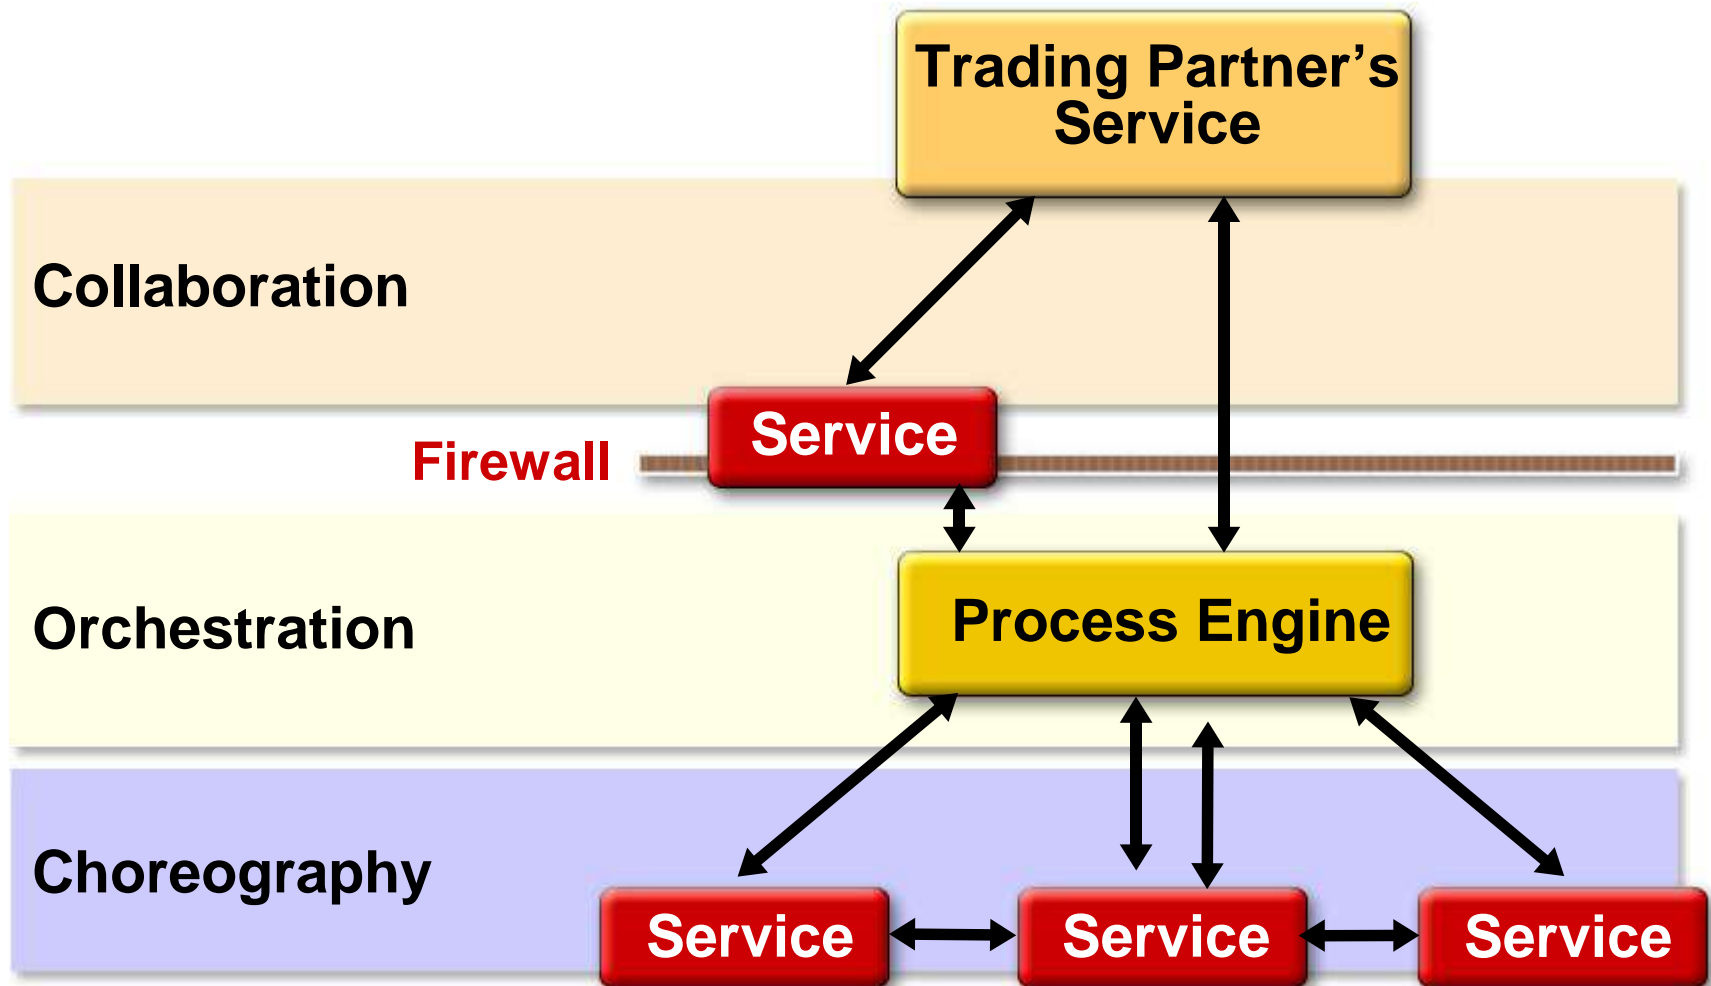

Definitions (Cont.)

Definitions (Cont.)

Definitions (Cont.)

Choreography

- Sequencing of Service operations
- Direct dependencies
- Interface
 - Observable messages
- Constrains client using Service

Orchestration

- Process Engine
 - Invokes Services
 - Offers Services
 - Stateful
 - Complex rules:
 - Sequencing
 - Concurrent sequences (flows)
 - Synchronization of flows
- Conforms to Choreography for each Service used

Collaboration

- B2B (Peer-to-peer)
- Message exchange only
- Like paired services, but
 - Uses Internet
 - Trading Partner Agreement
 - Business Semantics
- Electronic Data Interchange (EDI)

Abstract Models

- Abstract Models
 - Influence Specifications
 - Model Checking
 - Emphasize certain aspects
- π -Calculus
- Petri Nets
- State Diagrams/Activity Diagrams

π -Calculus

- Model of concurrent computation
- Interacting, named agents
- Dynamic configuration
- “Calculus of Mobile Processes”
- Influence on newer process specifications

Petri Nets

- Model of concurrent, interacting systems
- Graph of
 - Places
 - Transitions
 - Directed arcs connecting transitions and places
- Models
 - Collaboration
 - Orchestration
- Good for modeling, not execution

Petri Nets

State Machine

- States linked by directed transitions
- More detail than Petri net
- Simple synchronization primitives
- Models
 - Simple orchestration
 - Most choreographies
- UML StateChart, Sequential Function Chart, Grafcet, etc.

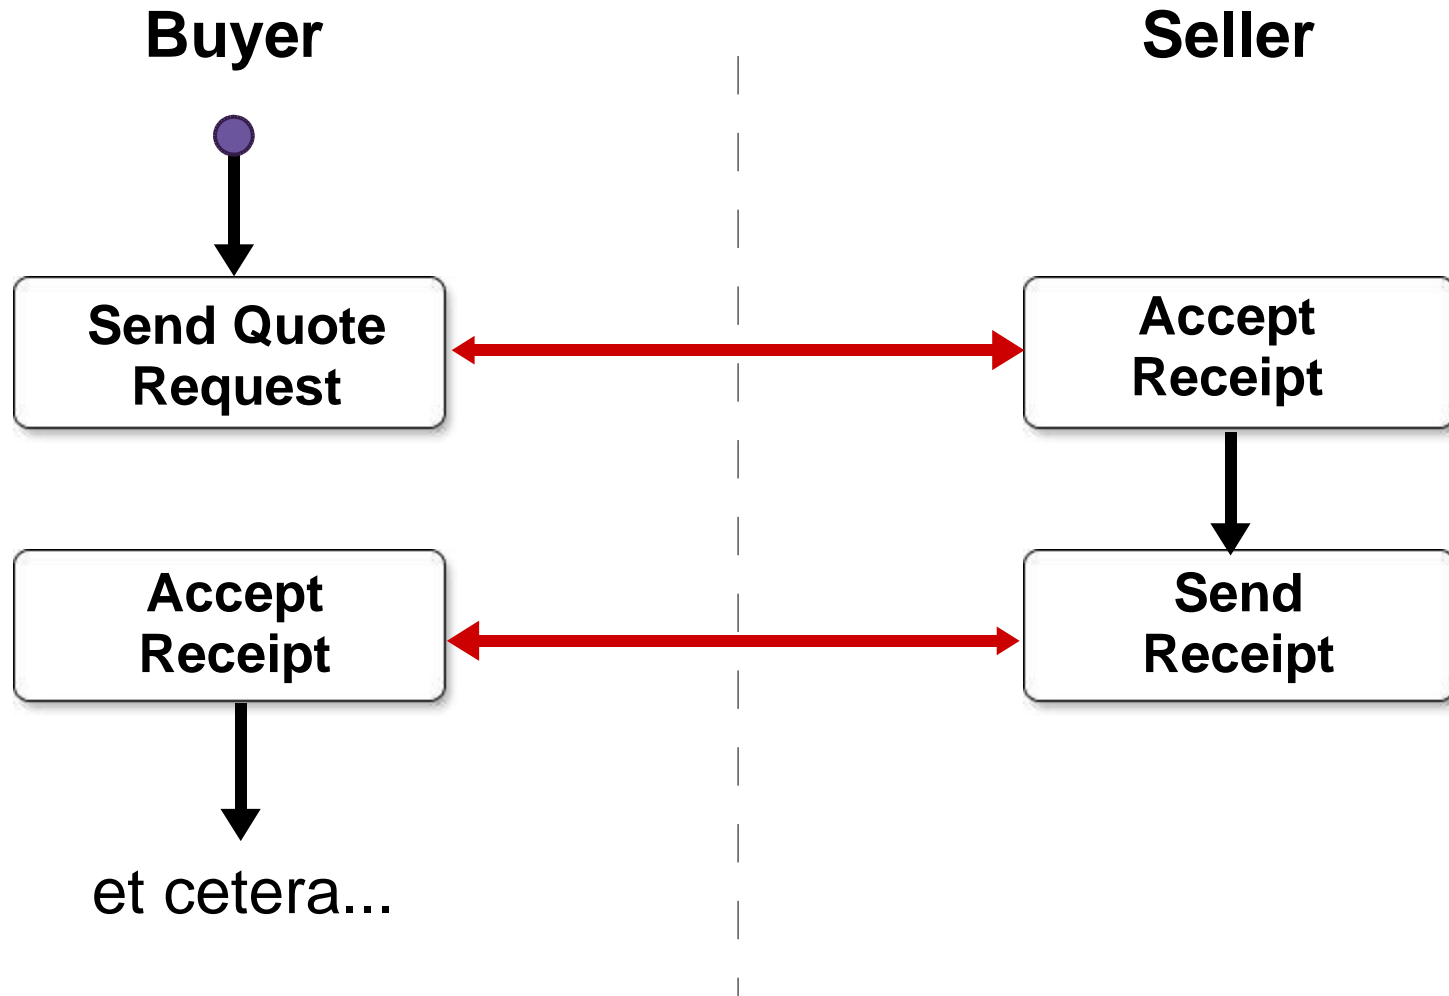

State Diagram

Activity Diagrams

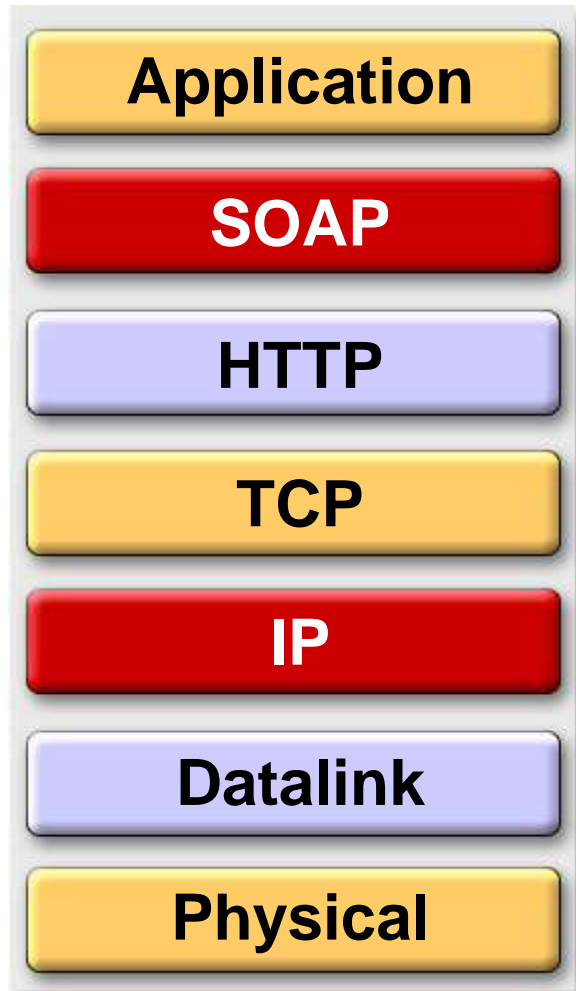

- UML variation of State Machine
- Roles (“Swim lanes”)
- Initiating role
- Message exchange between roles
- Models
 - Collaboration
 - Orchestration (optionally)

Activity Diagrams

Web Services

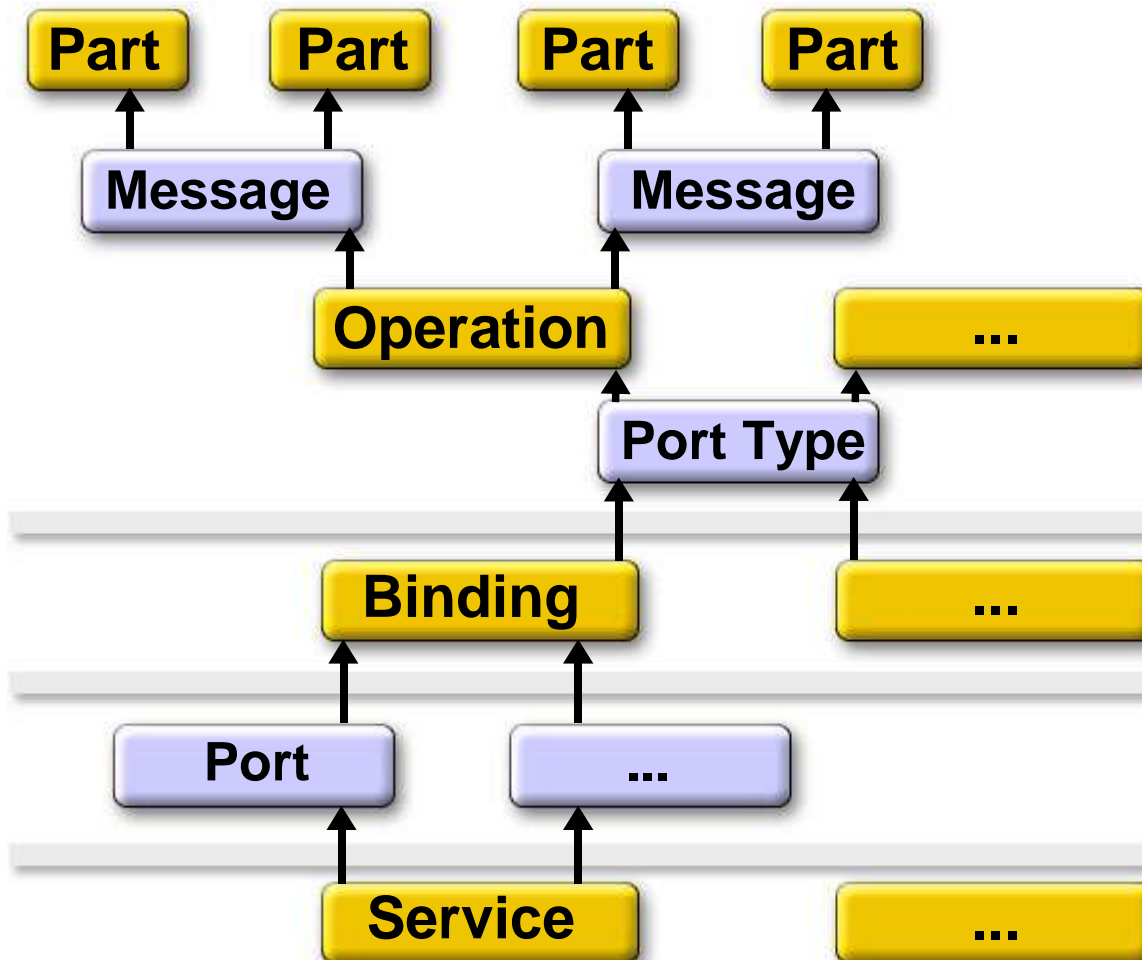

- Technology stack
- Based on web protocols
- Port 80 as a tunnel
- SOAP 1.1
 - RPC
 - Message exchange
- WSDL 1.1
 - Description of service
 - Bind service to SOAP

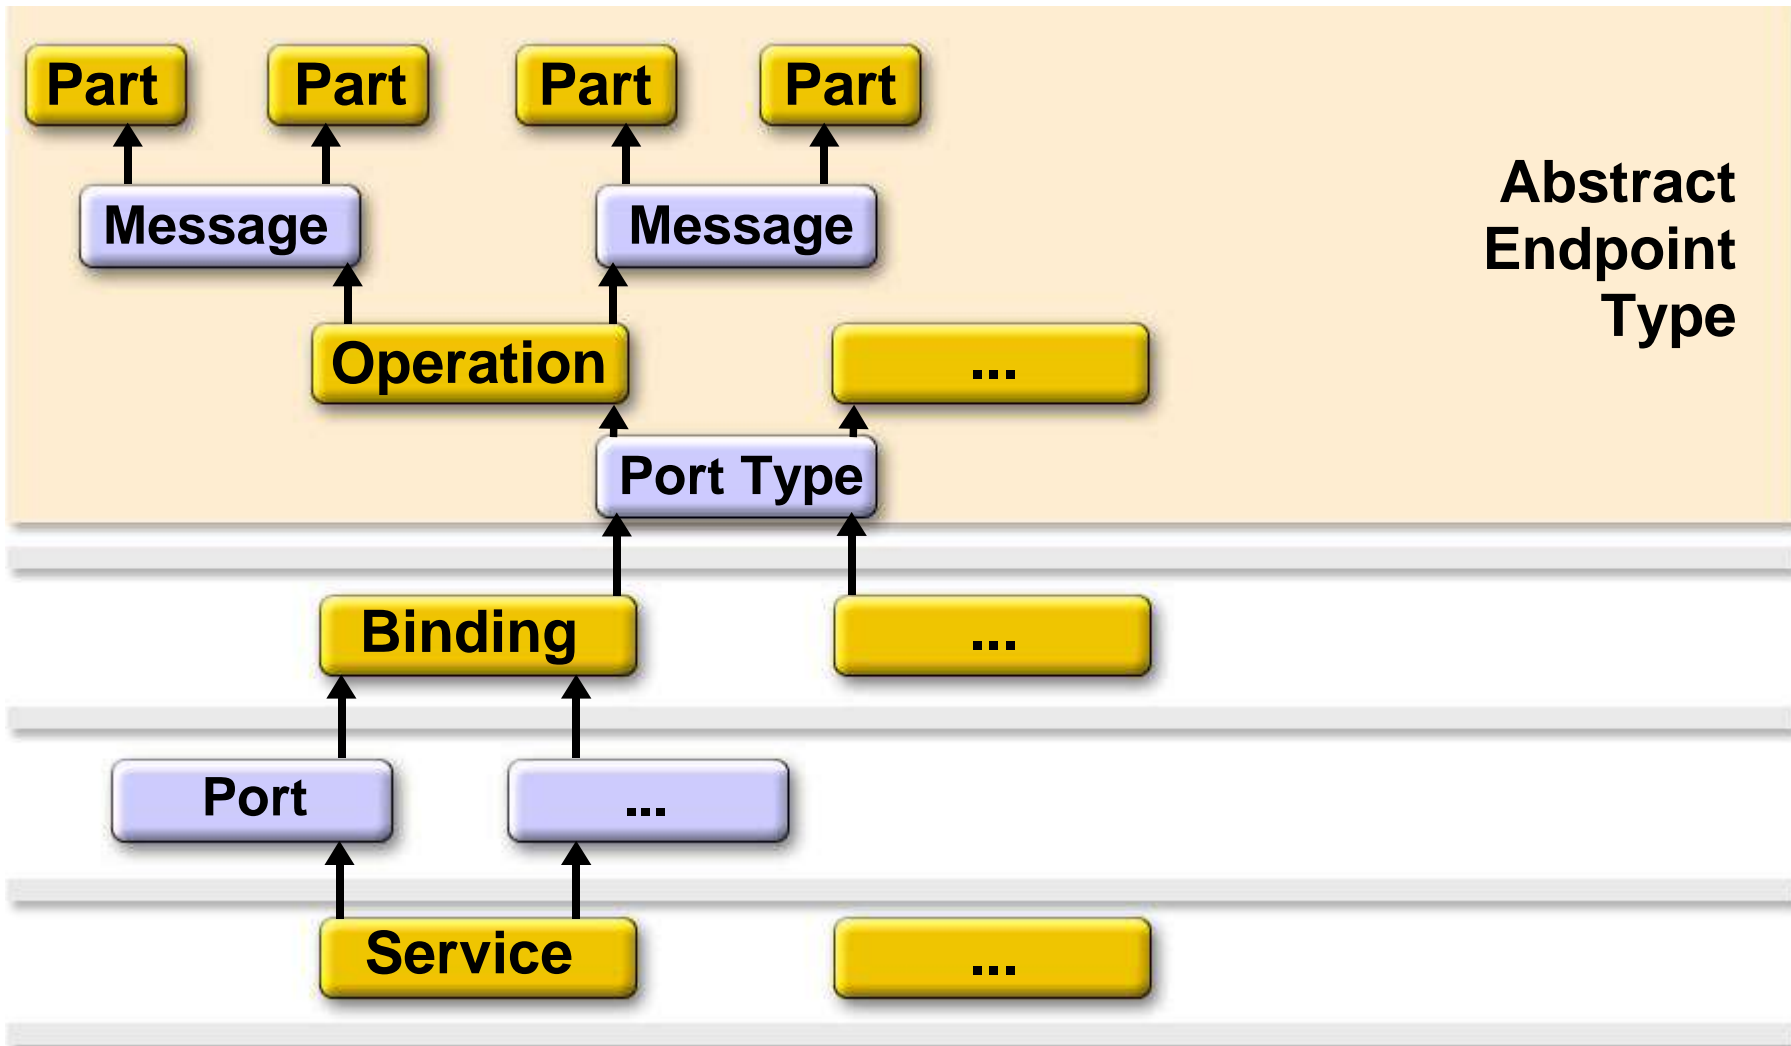

The Problem With Web Services

- Web Services Description Language 1.1
 - Operations, Operations Everywhere
 - Services modeled as message exchanges
 - Unordered
- No Choreography
- No Collaboration
 - Paired services pattern
- Orchestration: Not applicable

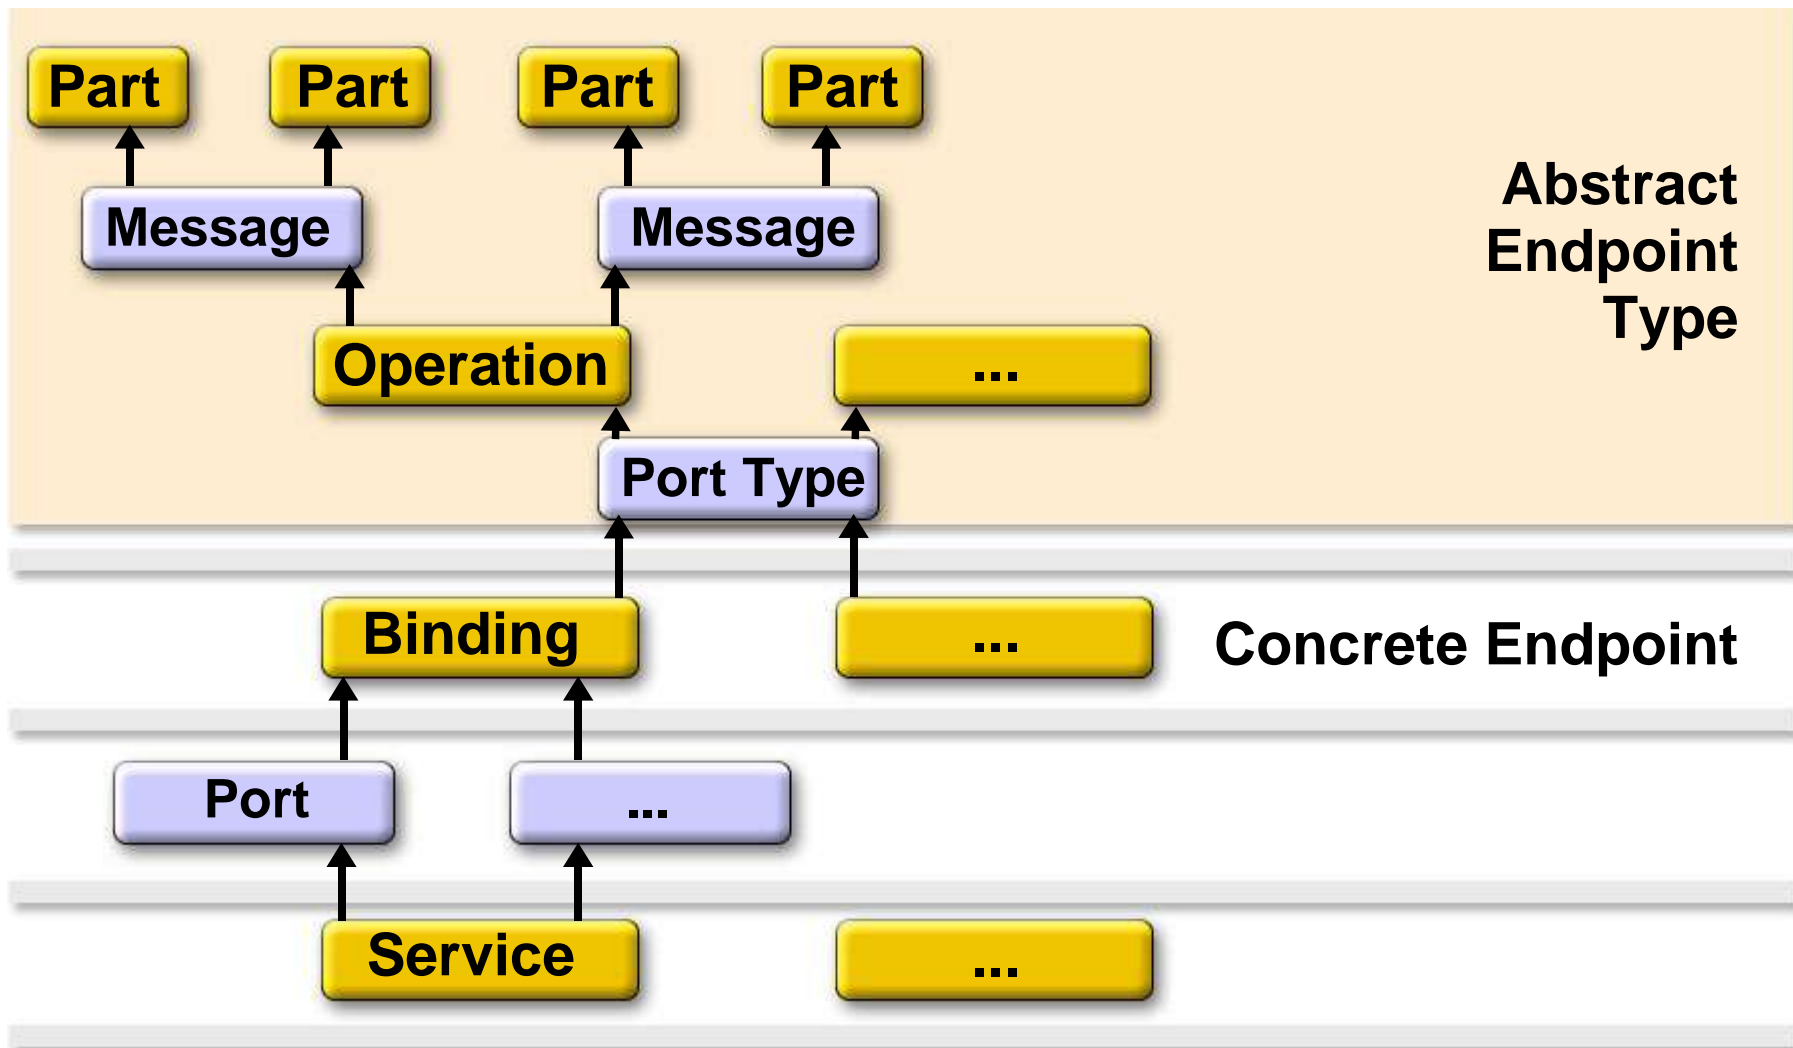

WSDL Structure

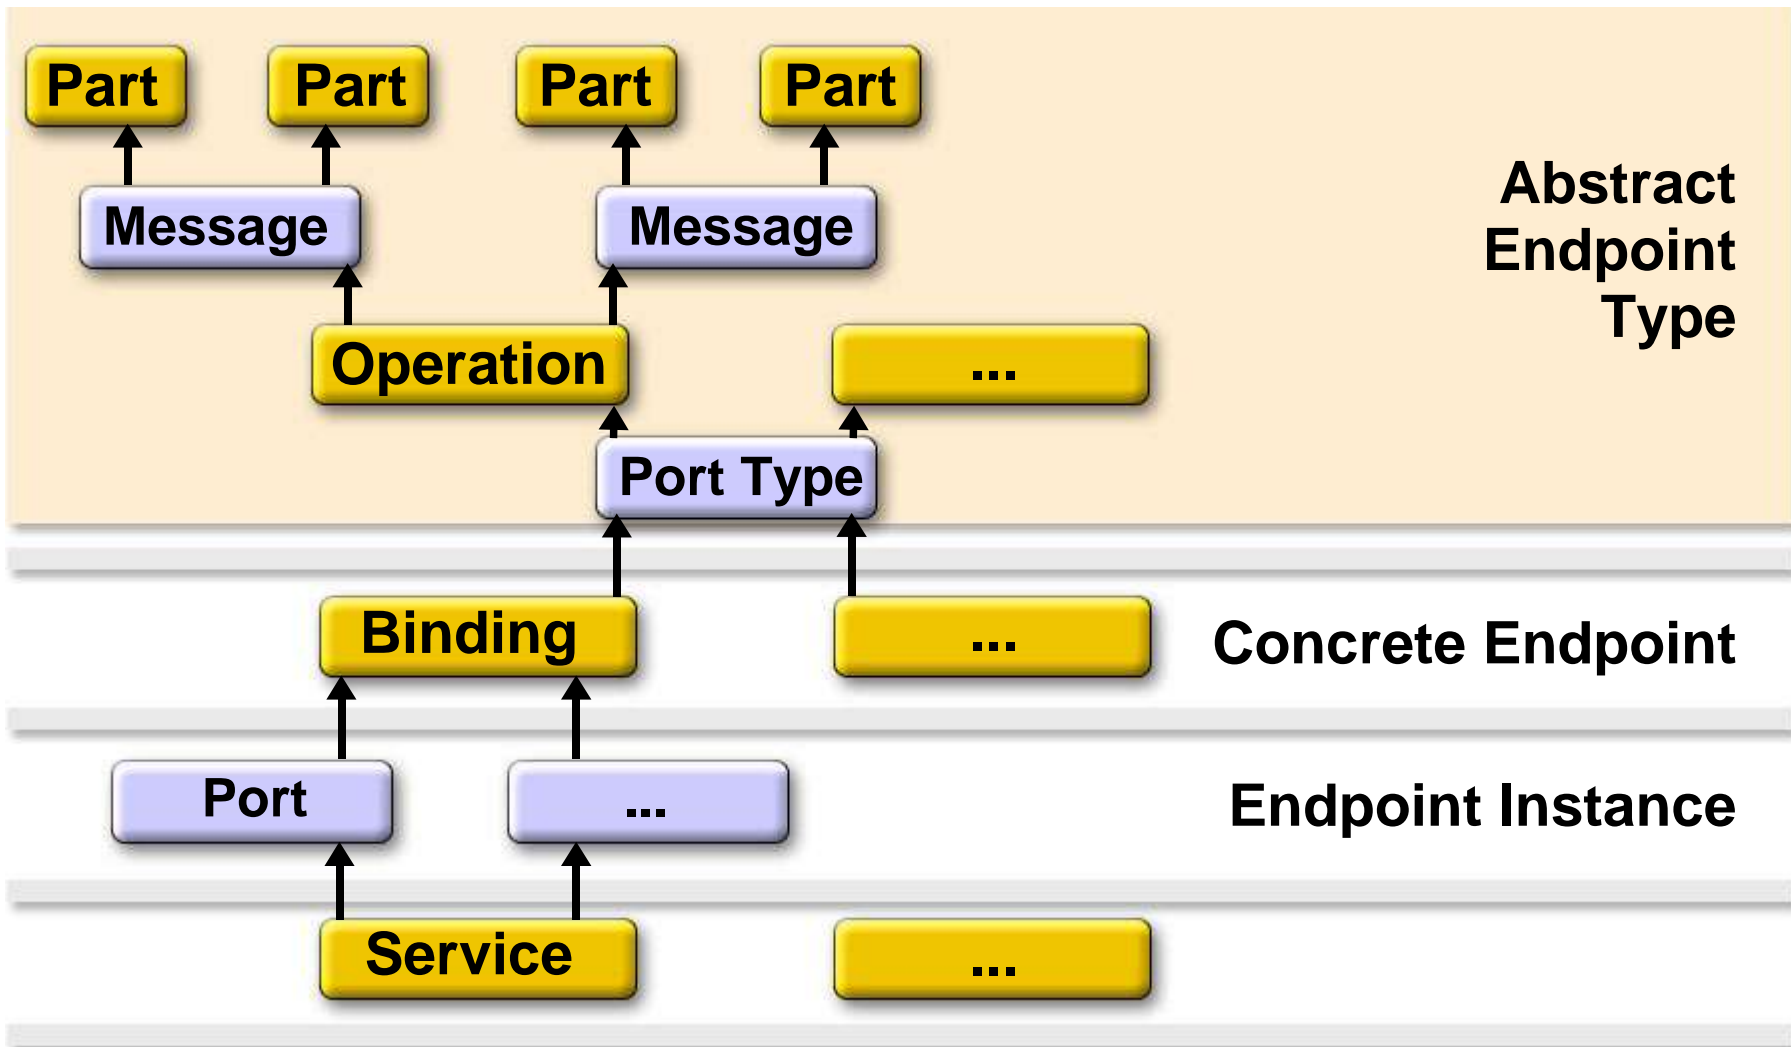

WSDL Structure

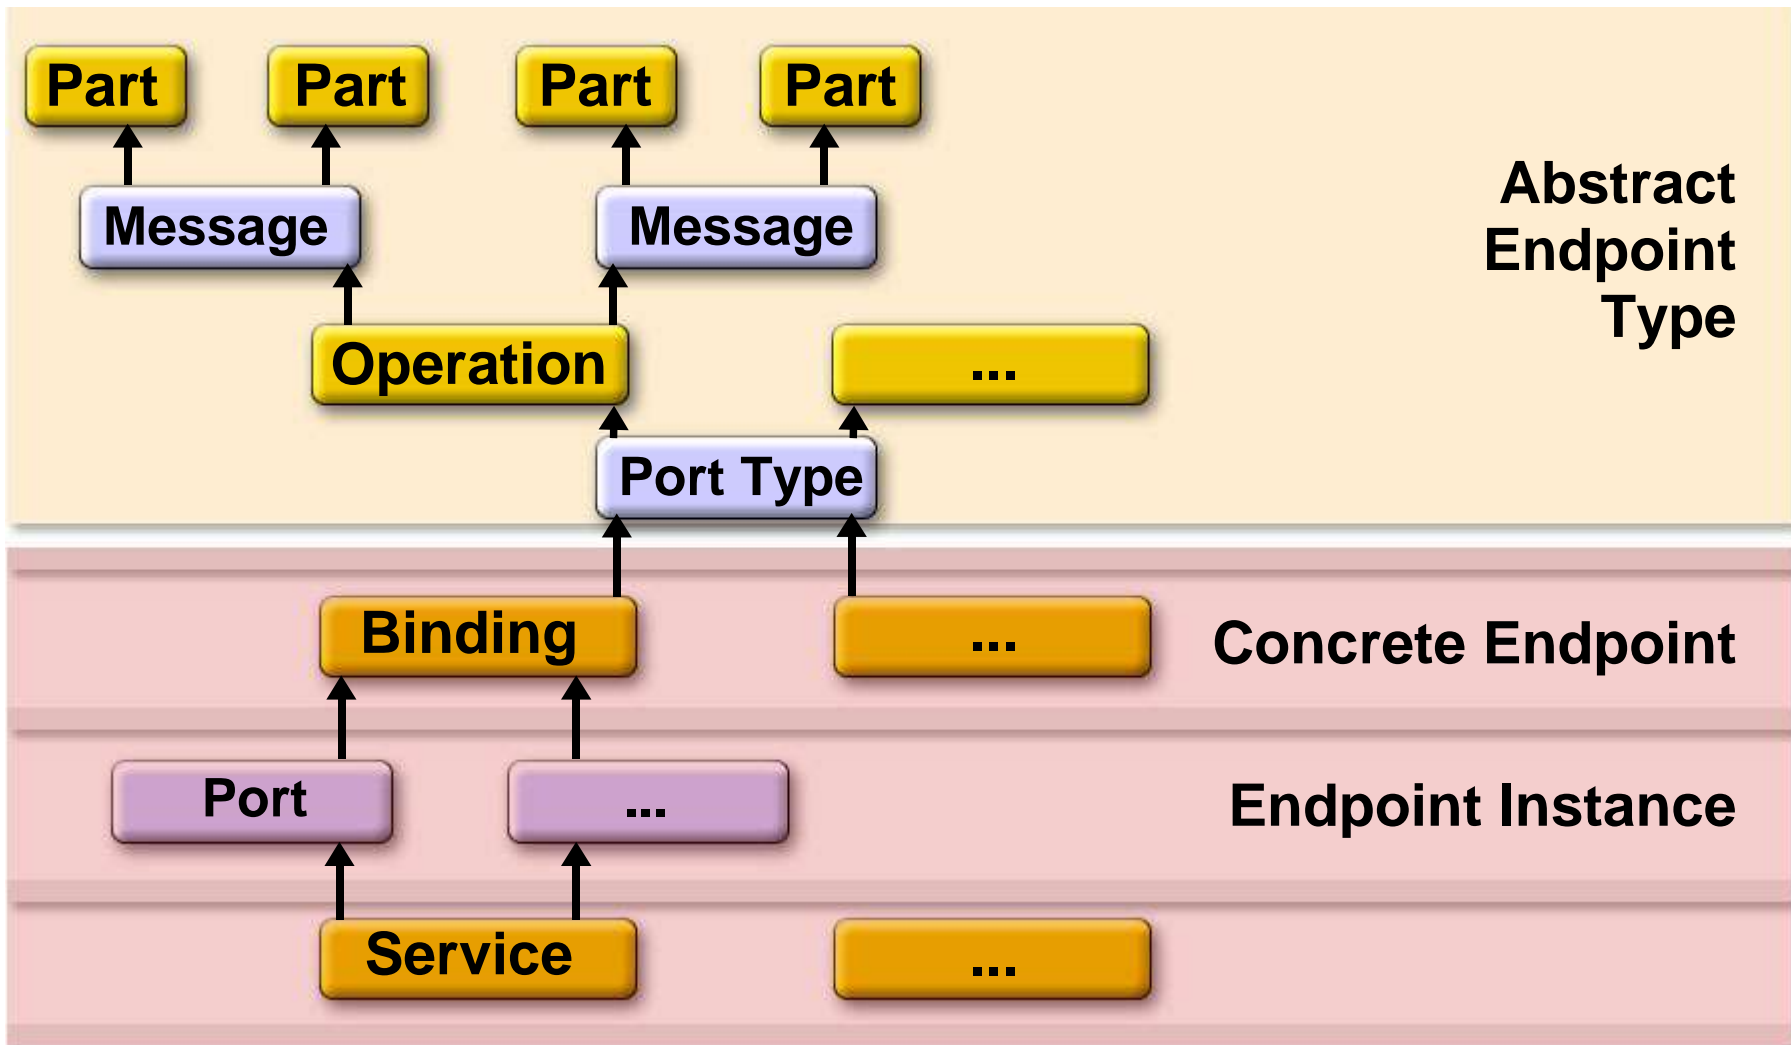

WSDL Structure

WSDL Structure

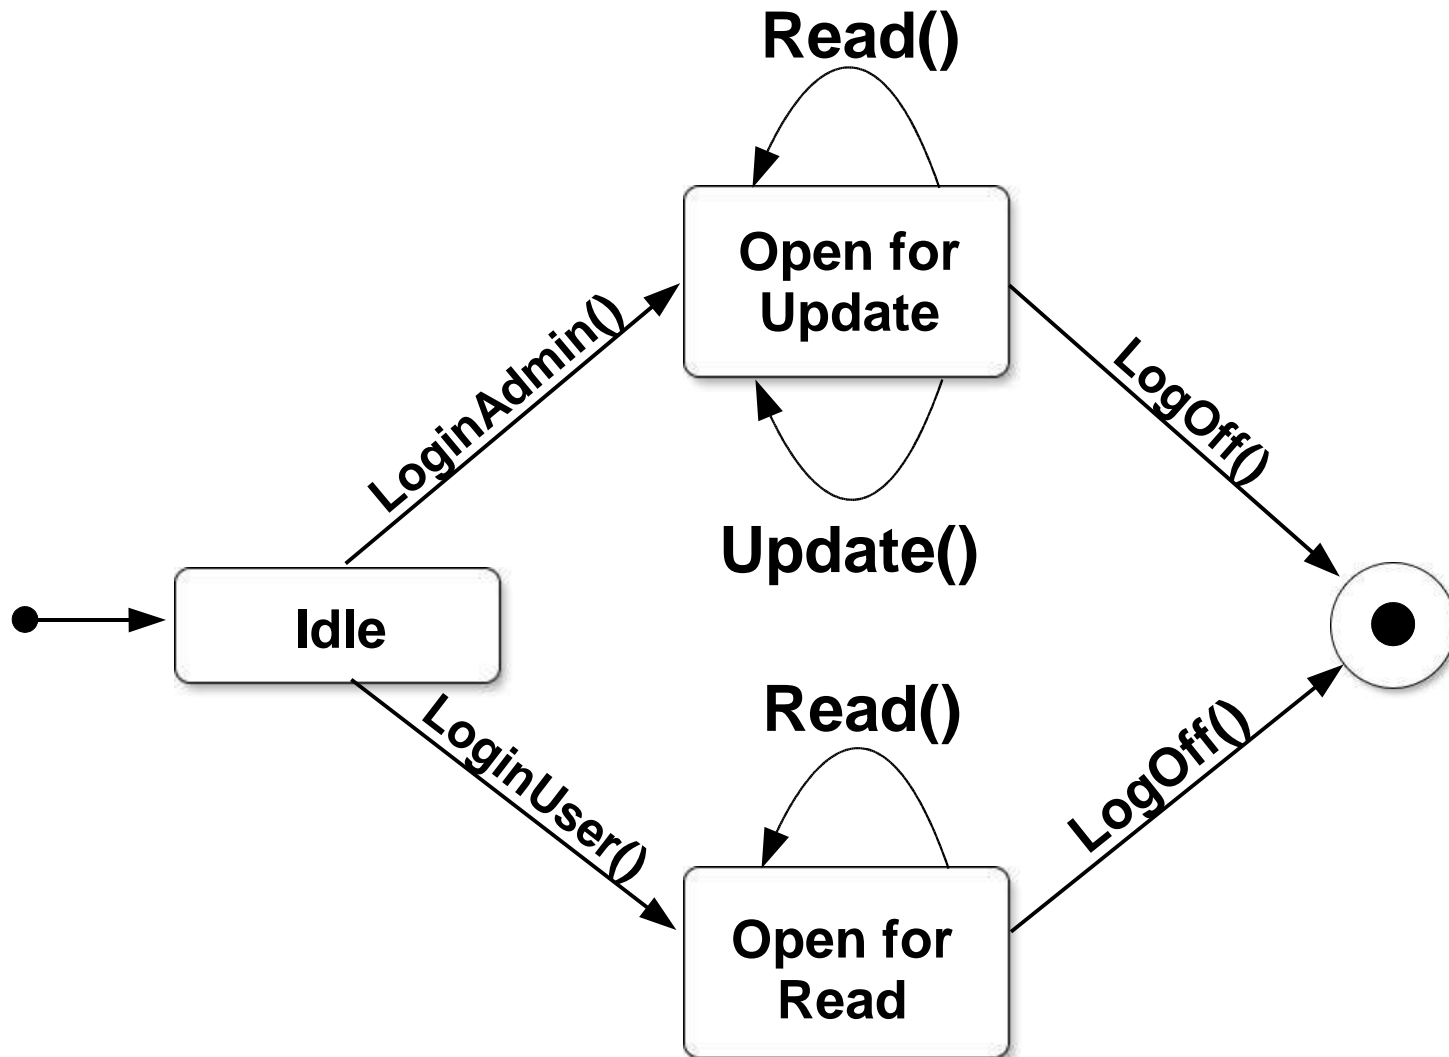

WSDL Structure

Web Service Choreography

- Layered on top of PortType
 - Reuse
- Client/Service contract
- Ordering of Operation invocations

Choreography Example

Simple Choreography Isn't Enough

- Pure Client/Service
 - Only one initiator
 - Synchronous Messaging
- Single Service Only

Specifications to the Rescue

- WSCL 1.0
 - Basic choreography language
 - Layered directly atop WSDL 1.1
- WSCI 1.0
 - Rich choreography language
 - Layered directly atop WSDL 1.1
- BPEL4WS
 - Broad orchestration language
 - Choreography support
 - Layered directly atop WSDL 1.1

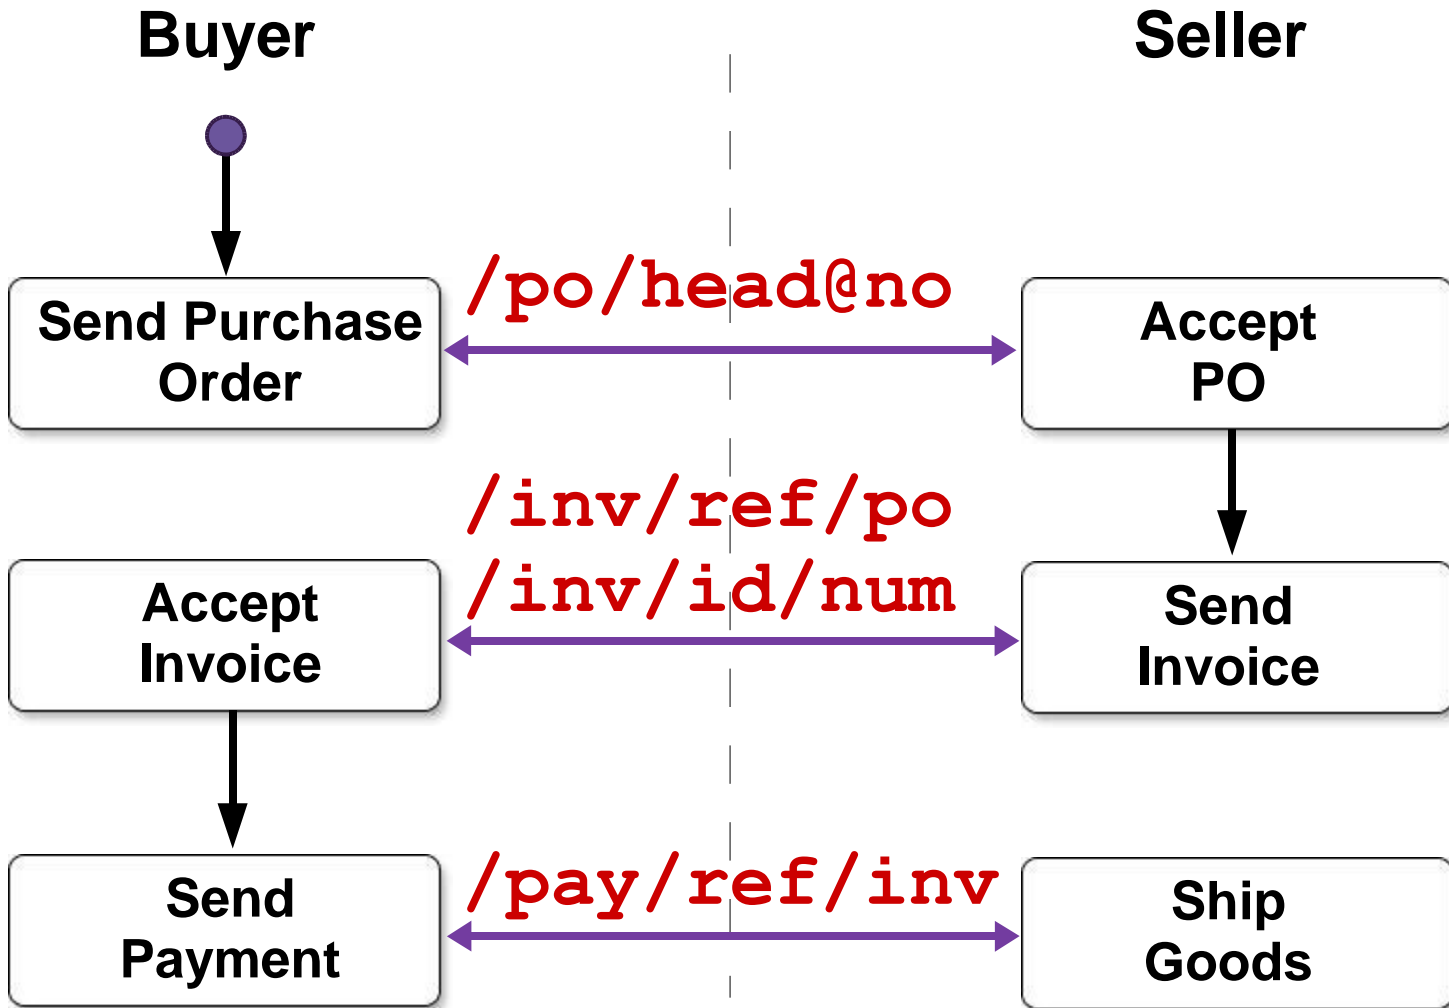

Added Features

- Correlation
- Transactions
- Exceptions
- Compensation
- Roles
- Dynamic Participation

Correlation

- Asynchronous responses
 - How to correlate to request?
- ebXML message meta-data
 - Unique message IDs
 - Ref-to message ID
- Use message content
 - E.g., purchase order number
- Multiple correlation items possible

Correlation Example

Transactions

- Multiple operations complete or fail like a single one
- Various models:
 - ACID—Atomic
 - Locks resources
 - Costly for long-running operations
 - Nested (Open)
 - Relaxes isolation requirement
 - Complex error recovery
- In tension with loose coupling

Exceptions

- Choreography distinguishes:
 - “Happy path”
 - Error paths
 - Technical problems
 - Fault response from Service
 - Multiple types
- Error paths can
 - Retry
 - Complain
 - Clean up

Compensation

- Undo a committed transaction/operation
 - Needed in open transaction model
 - Distinct from rollback
- Explicit compensation handler
 - Sequence of operations to achieve “undo”

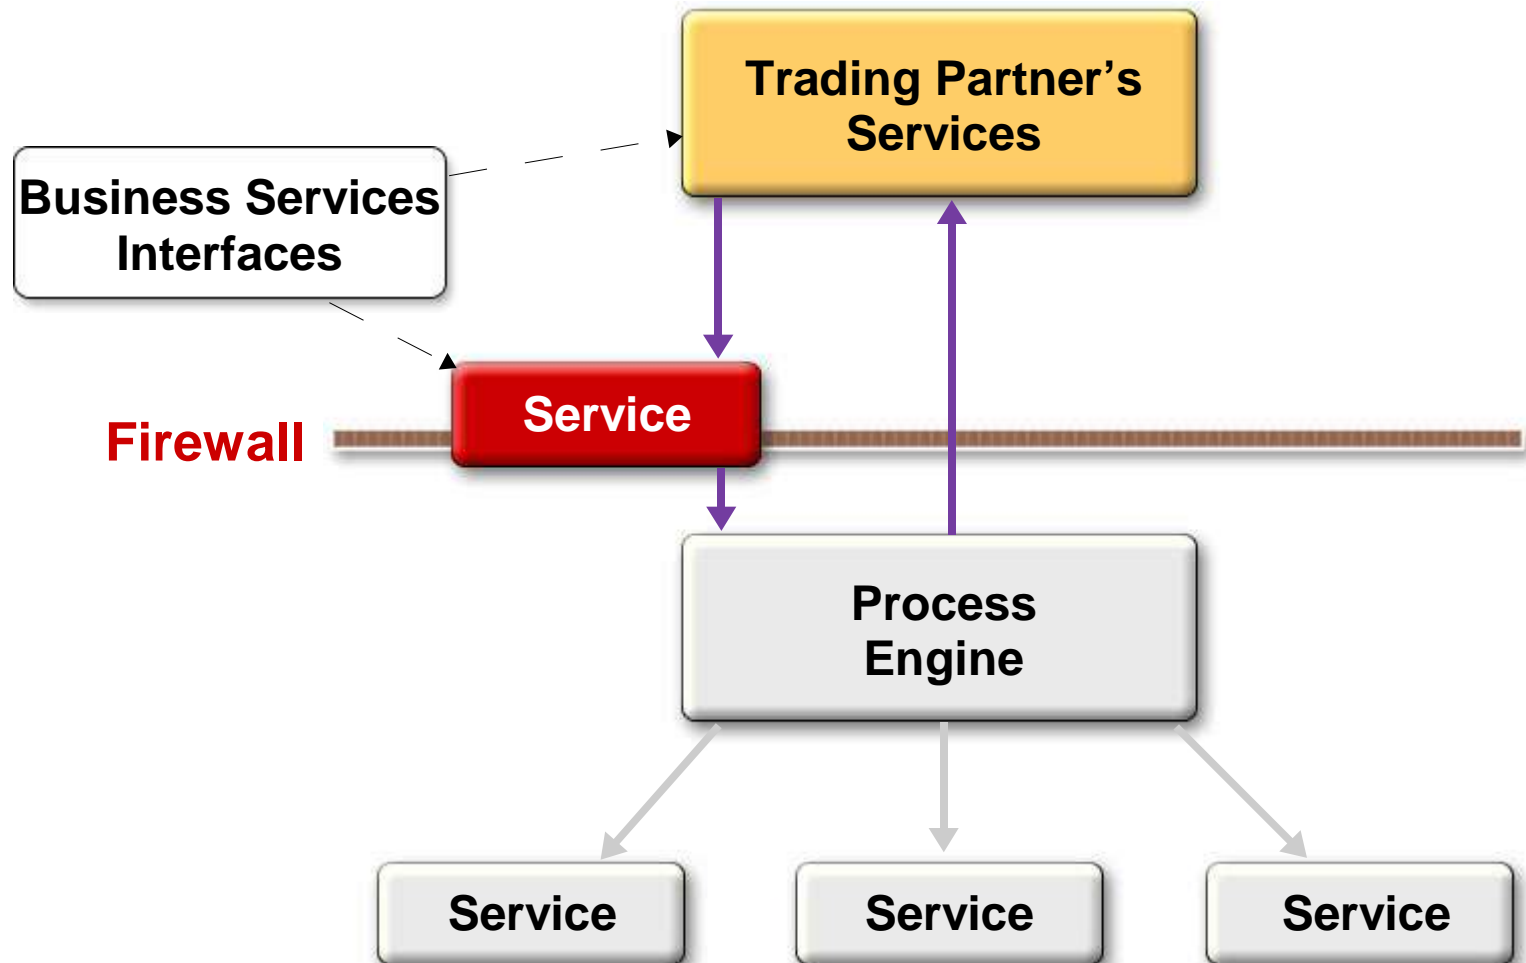

Roles

- Assigning role names to port types
- Pairing roles
 - E.g., Buyer, Seller
 - Links port types directly

Dynamic Participation

- Selection of target service at run-time
- Uses dynamic data
 - Message contents
 - Previous message contents
- π -Calculus influence
 - Service address is a channel
 - Port type is channel type

Business Web Services

Business Web Services

- Web Services Plus:
 - Reliability
 - Security
 - Direct support for business semantics
- EDI—Electronic Data Interchange
 - Electronic business documents
 - Many data formats
 - Value Added Network—VAN
 - Expensive

Business Web Services

- Binary or multi-party collaborations
- Complex sequencing
- Trading partner agreements (contracts)
- Peer-to-peer shared views:
 - State management
 - Business semantics, rules, constraints
- Integration with internal business systems:
 - Business processes
 - Applications

Business Web Services Are Different

- B2B Transactions
 - Coarse-grained
 - Map to business activities
 - Have economic and legal consequences
 - No shared infrastructure
- Internet
 - Insecure
 - Unreliable
 - Ubiquitous, cheap

ebXML for Business Web Services

- “Cheap” EDI:
 - Internet protocols
 - Reliable, secure messaging atop SOAP
 - XML for data
 - Standard business documents:
 - CC—Core Components
 - UBL—Universal Business Language
 - Standards based, interoperable

ebXML for Business Web Services

- Suite of loosely-coupled specifications
 - CPP/CPA
 - Trading partner agreement
 - Message Handler
 - Secure, reliable messaging over Internet
 - CPA configures handler quality-of-service for each transaction
 - BPSS
 - Binary and multi-party collaboration
 - Business transaction model
 - Core Components, UBL

CPP/CPA

- Ultimate WSDL
- Trading partner agreement
 - Roles assigned to partners
 - All messages described
 - Endpoints defined
 - All message exchanges defined
 - Quality of service
 - Security
 - Reliability

Message Handler

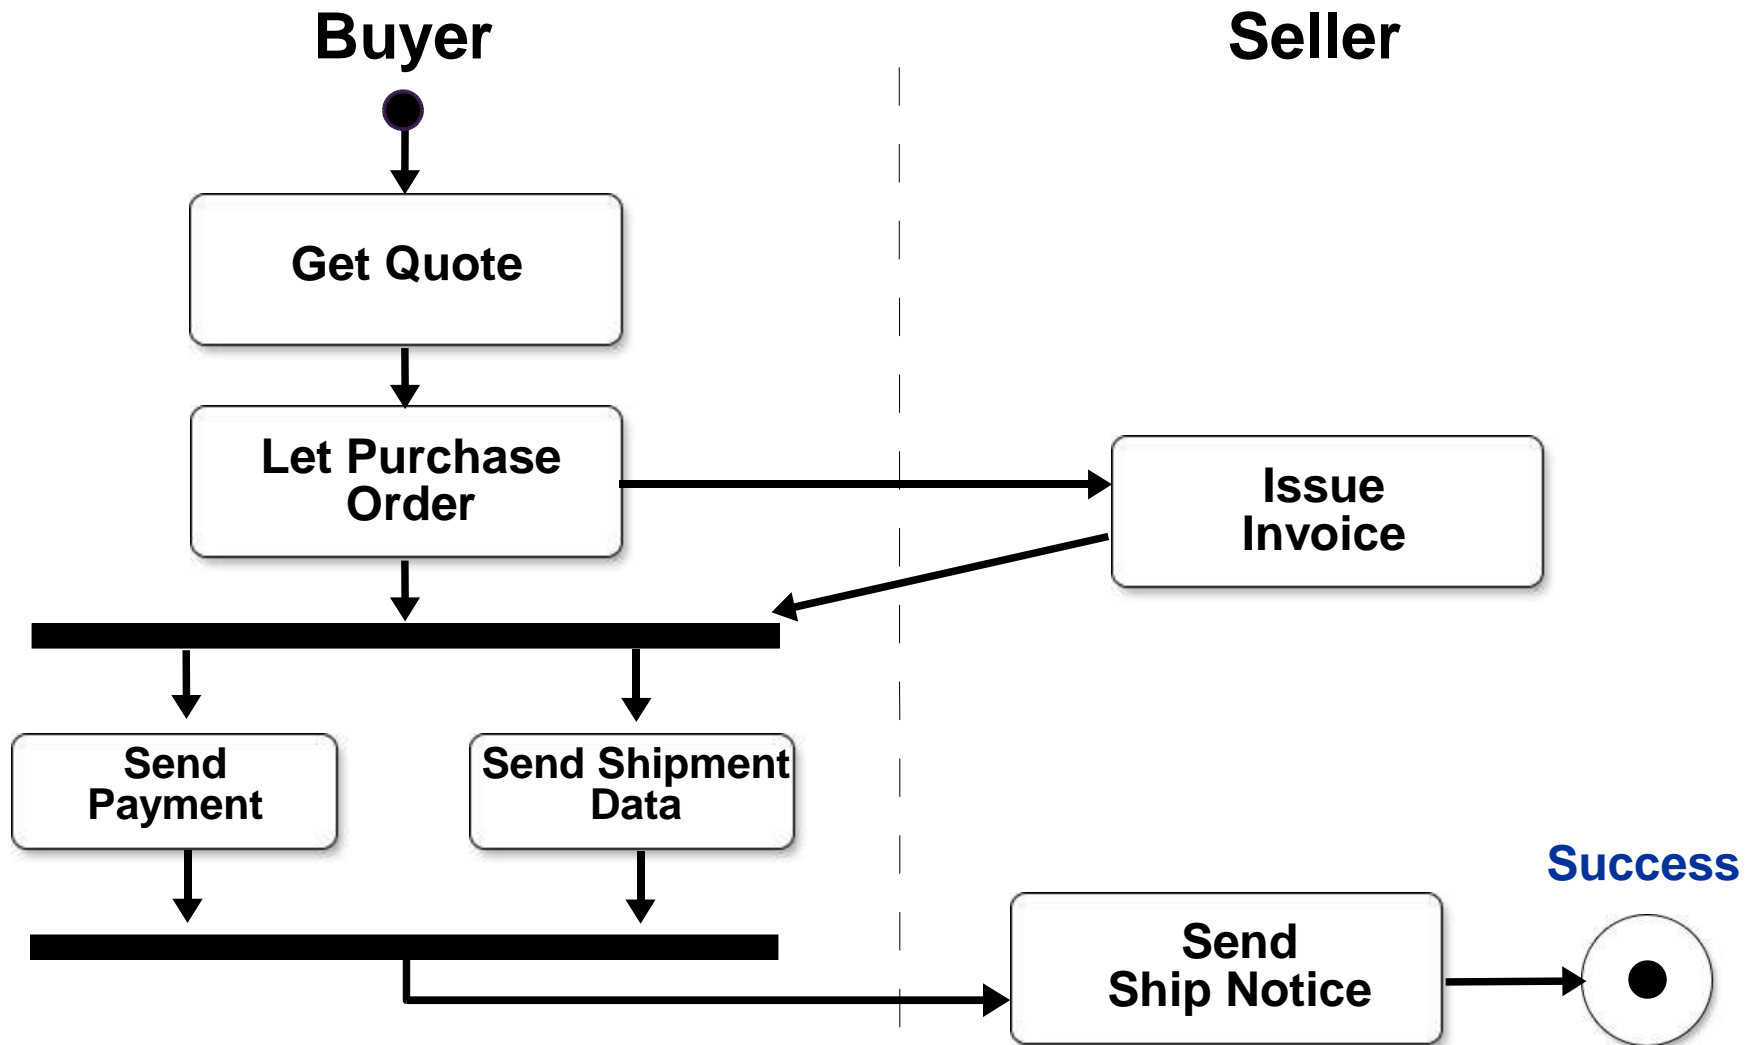

- Configured by CPA(s)
- Provides
 - Security
 - Confidential
 - Tamper-proof
 - Authentication of sender
 - Reliability
 - Once-and-only-once delivery
- Interoperable
 - Many implementations available

Business Process Specification Schema

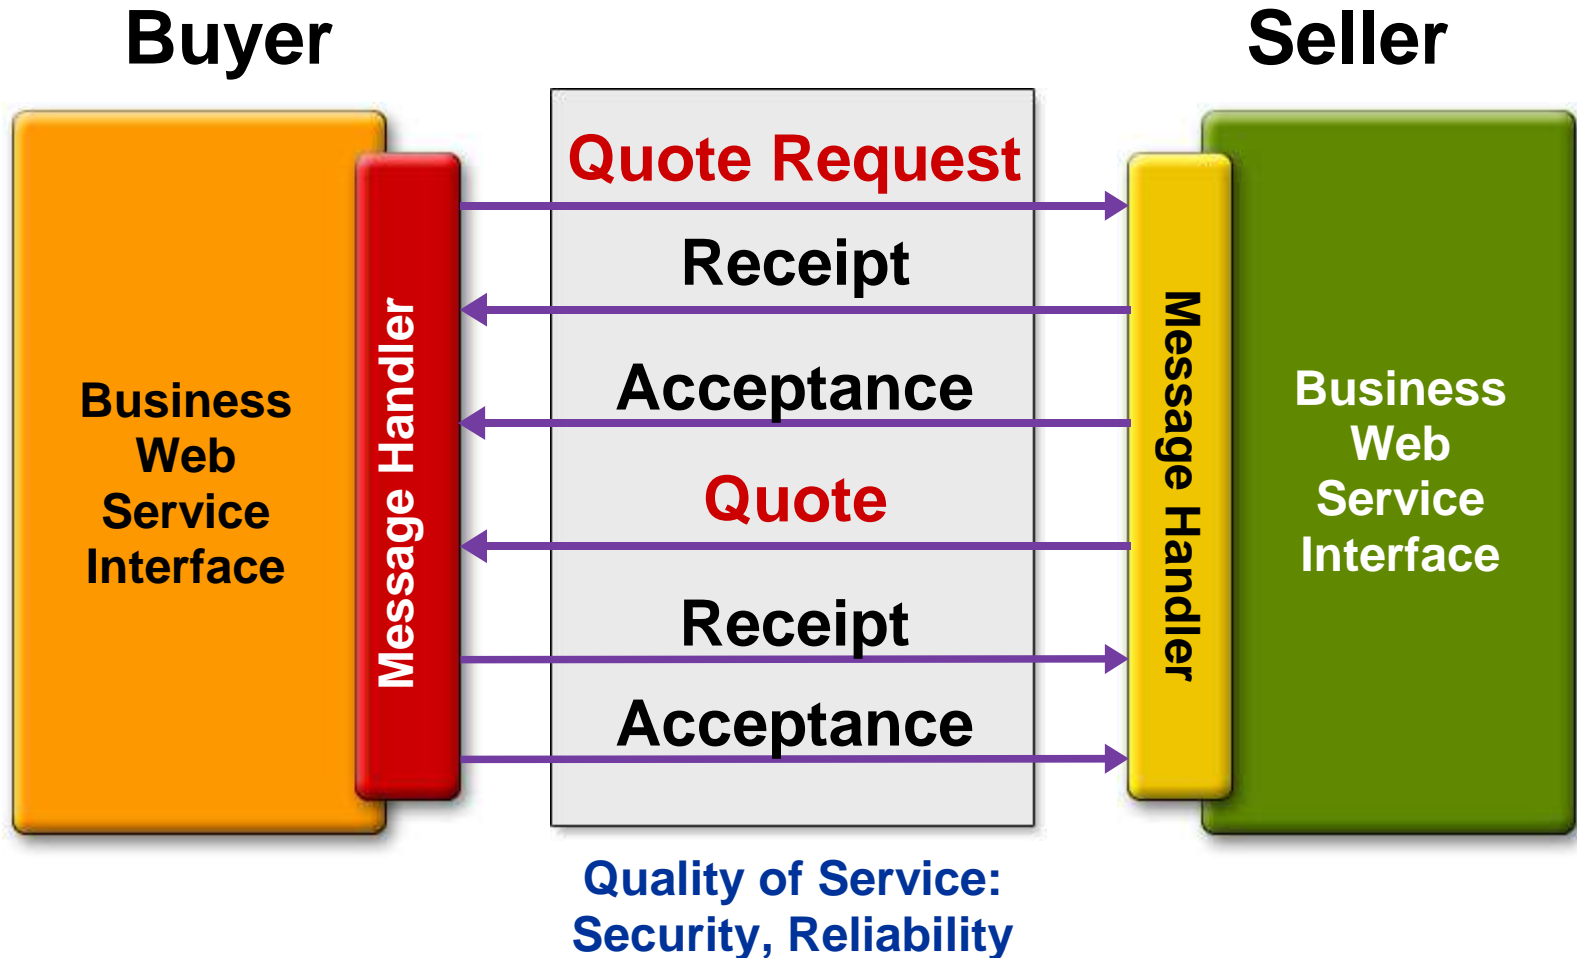

- Collaborative business process definition
 - Role-based
 - Binary and multi-party
- Defined atop abstract model of MSH
- Shared view of process state
 - Message exchange
 - business signal protocol
 - Common process definition
- Rich set of business-oriented features

- Process models similar to UML Activity Diagrams
 - Stereotyped activity “Business Transaction”
 - Business protocol
 - Multiple document exchanges
 - Time outs
 - Simple set of result types
 - Succeeded,
 - Failed for technical reasons, failed for business reasons, etc.
 - Roles mapped to swim lanes
 - Concurrent activities

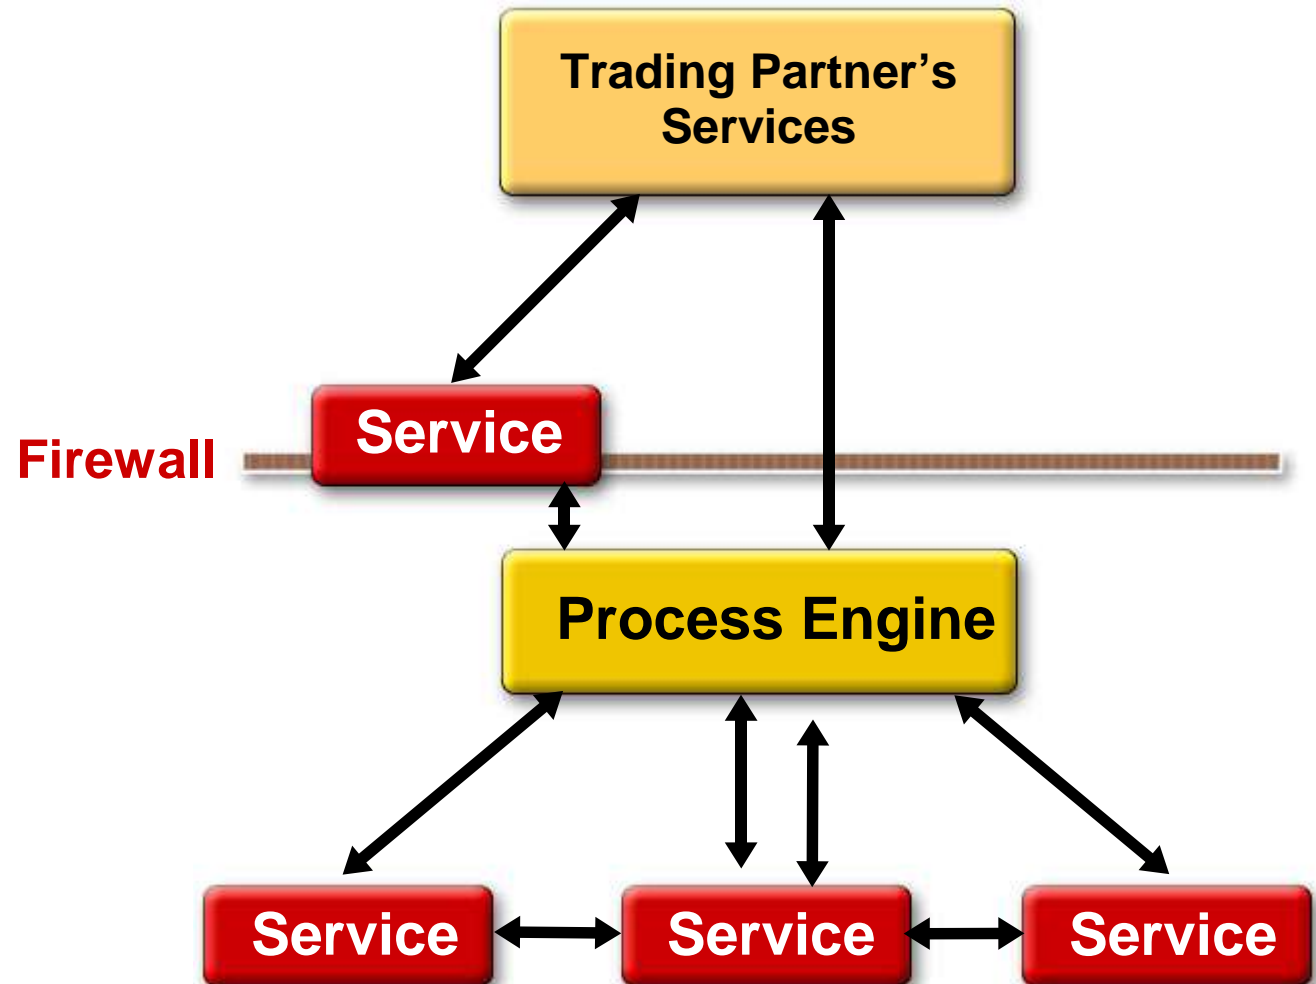

BPSS Example

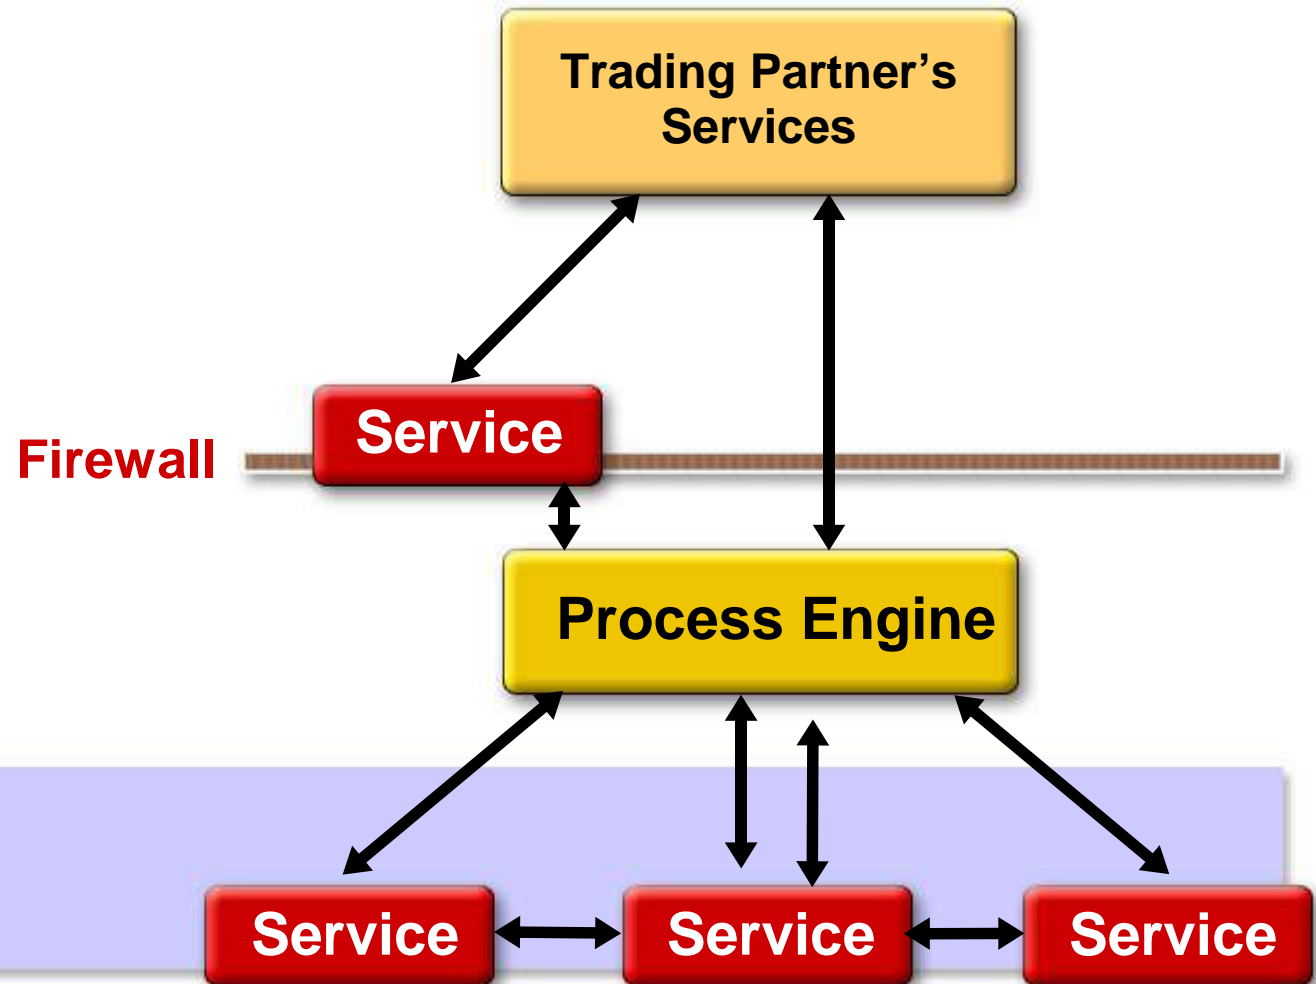

Business Transaction Activity: Get Quote

Summary

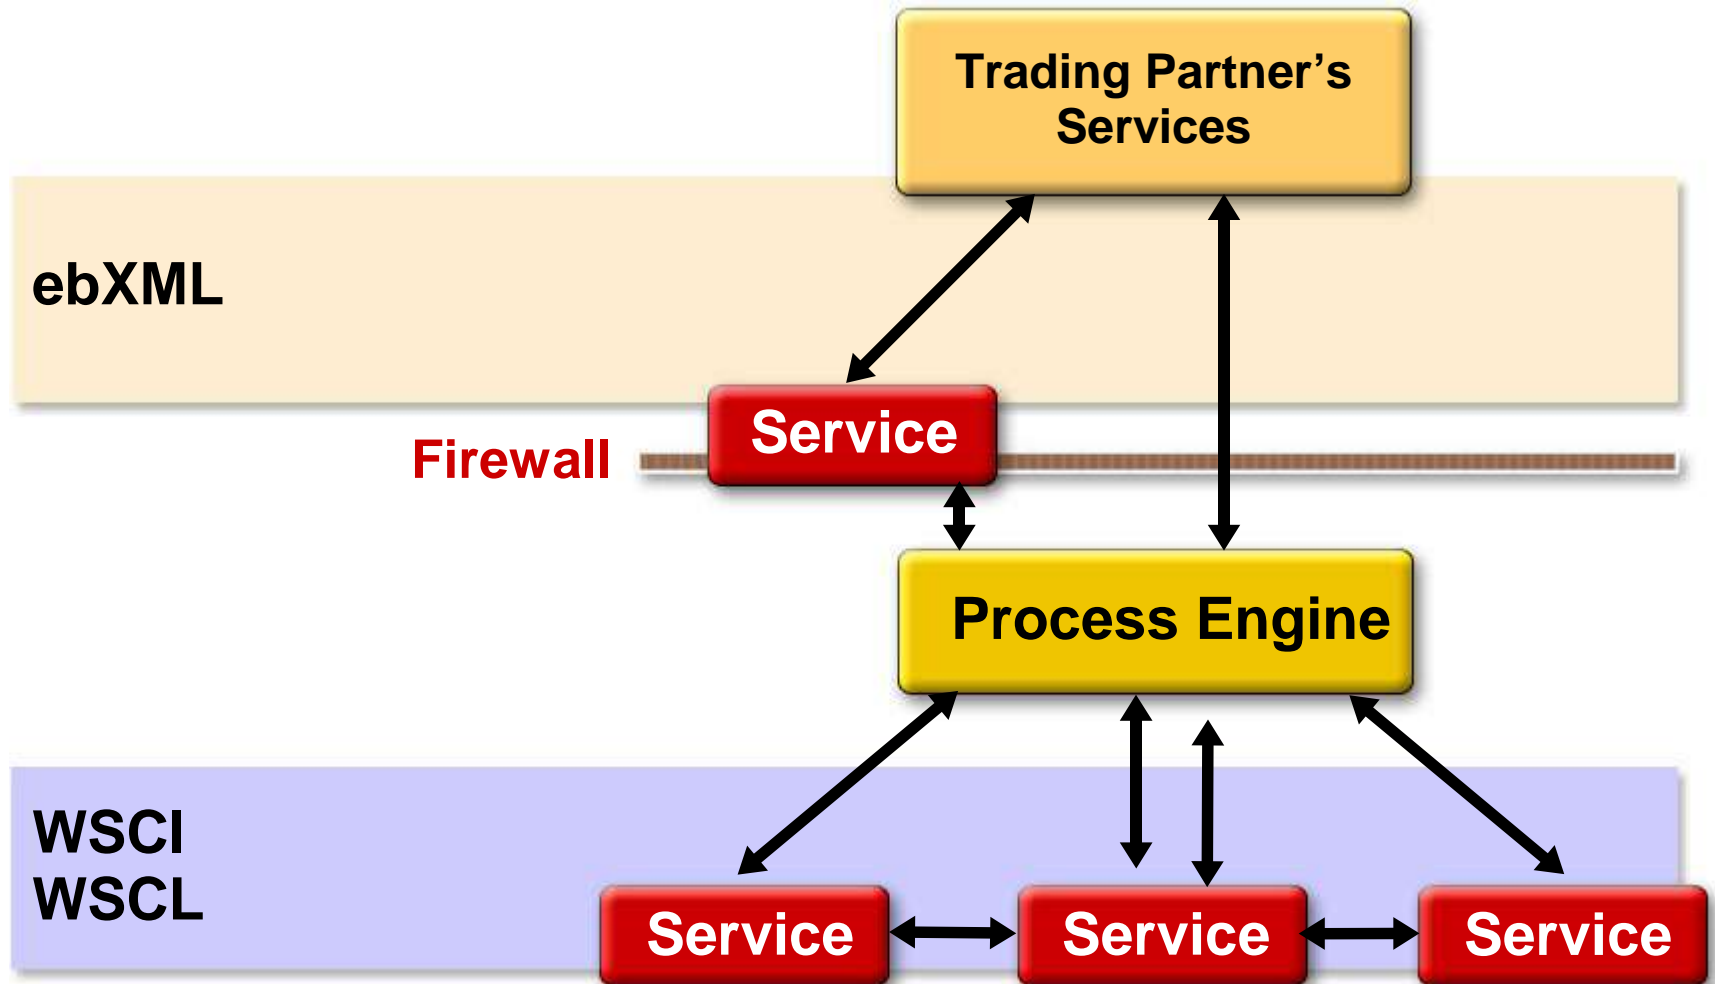

Summary

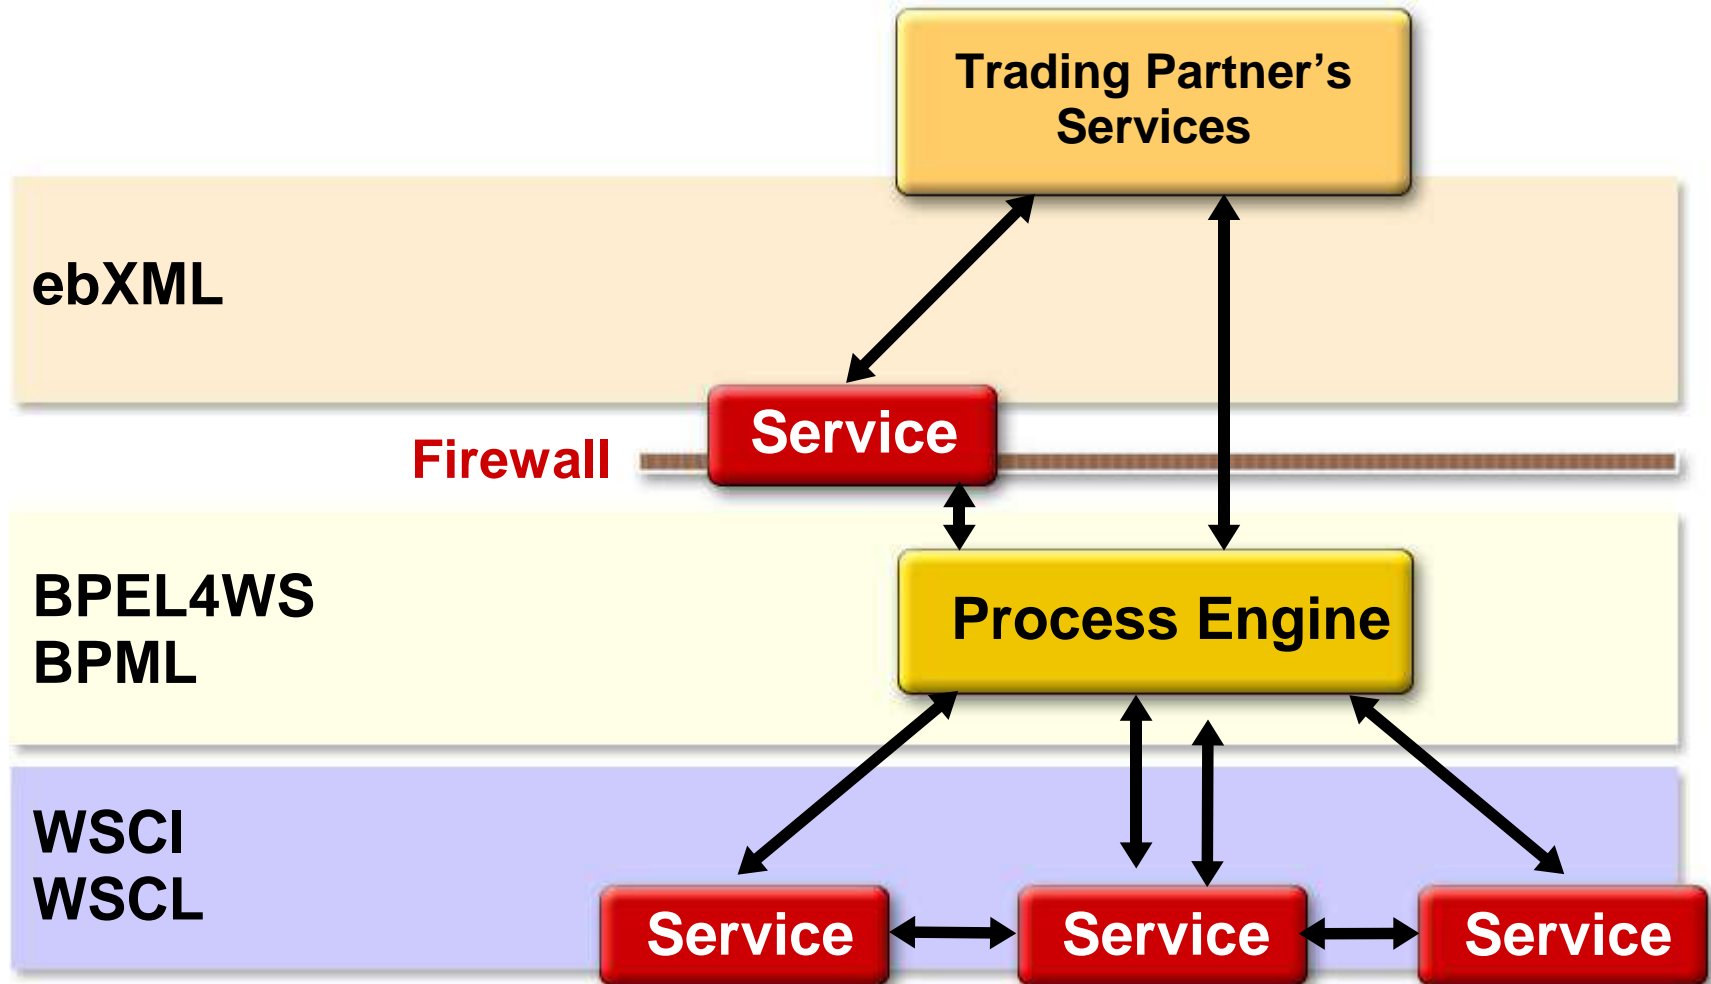

WSCI
WSCL

Summary

Summary

Summary

- Distinct technical meanings
 - Collaboration
 - Orchestration
 - Choreography
- Abstract models
 - Help understand specifications
 - Help drive specifications

Summary

- Web Services
 - Service-oriented architecture
 - WSDL
 - Simple structure
 - Everybody is “fixing” it
 - Expanding Orchestration/Choreography features:
 - Correlation
 - Transactions/Exceptions/Compensation
 - Roles
 - Dynamic participation

Summary

- Business Web Services
 - Different from Web Services
 - EDI by Internet
 - ebXML provides
 - Reliable, secure messaging
 - Trading partner agreements
 - Shared business processes
 - Business semantics

If You Only Remember One Thing...

We don't have a Web Services silver bullet.

Different solutions are needed in different parts of an enterprise's EAI and B2B structures.
