

Ontology Summit 2013: Ontology Evaluation Across the Ontology Lifecycle

Track C: Building Ontologies to Meet
Evaluation Criteria

Background

- Two approaches to assuring the quality of an ontology:
 - 1. Measure quality of the result against the requirements that it should meet.
 - 2. Process or methodology to ensure the quality of the resultant ontology.
- That is, Proactive versus Reactive
- Methodologies are generally designed to ensure cost savings compared to after-the-event quality measures
 - Do these exist for ontologies?
 - How mature are they?
 - Do they take account of different ontology roles, lifecycles?

Methodologies

- Incorporate techniques for evaluation
- Link to software development lifecycles
- Take account of ontology usage scenarios
 - As deliverable application
 - As conceptual model

Mission

- Investigate the state of the art in ontology development methodologies, including key achievements and key gaps that currently exist.
 - Achievements: what's there?
 - Gaps: what's not there?

Objectives

- 1. Examine the explicit and implicit methodologies that are known to exist.
- 2. Understand the role that upper ontologies play in ontology development methodologies.
- 3. Understand the role of ontological patterns in ontology development methodologies.
- 4. Identify how to apply the intrinsic and extrinsic aspects of ontology evaluation identified by the other tracks, within the applicable development methodologies.
- 5. Identifying how to frame the applicable ontology development methodologies within the frameworks of established quality assurance regimes (such as ISO 9000 and CMMI) for industrial applications.

Track C Sessions

- 7 Feb 2012
- 14 March 2012
