

# Datalog<sup>±</sup>: A Unifying Framework for Ontological Reasoning and Query Answering

Georg Gottlob and Andreas Pieris

Department of Computer Science  
University of Oxford

Ontology, Rules, and Logic Programming for Reasoning and Applications,  
October 31, 2013

# The Need for Querying Ontologies

UML Class Diagrams

```

student::person
person[age *⇒ number]
person[age {0:1} *⇒ number]
person[name {1:*} *⇒ string]
  
```

F-Logic

```

Speaker ⊆ Person ⊓ ∃gives.Talk
Tutorial ⊆ ∀attendedBy.Student
attendedBy ⊆ attended1
Speaker ⊓ Student ⊆ ⊥
  
```

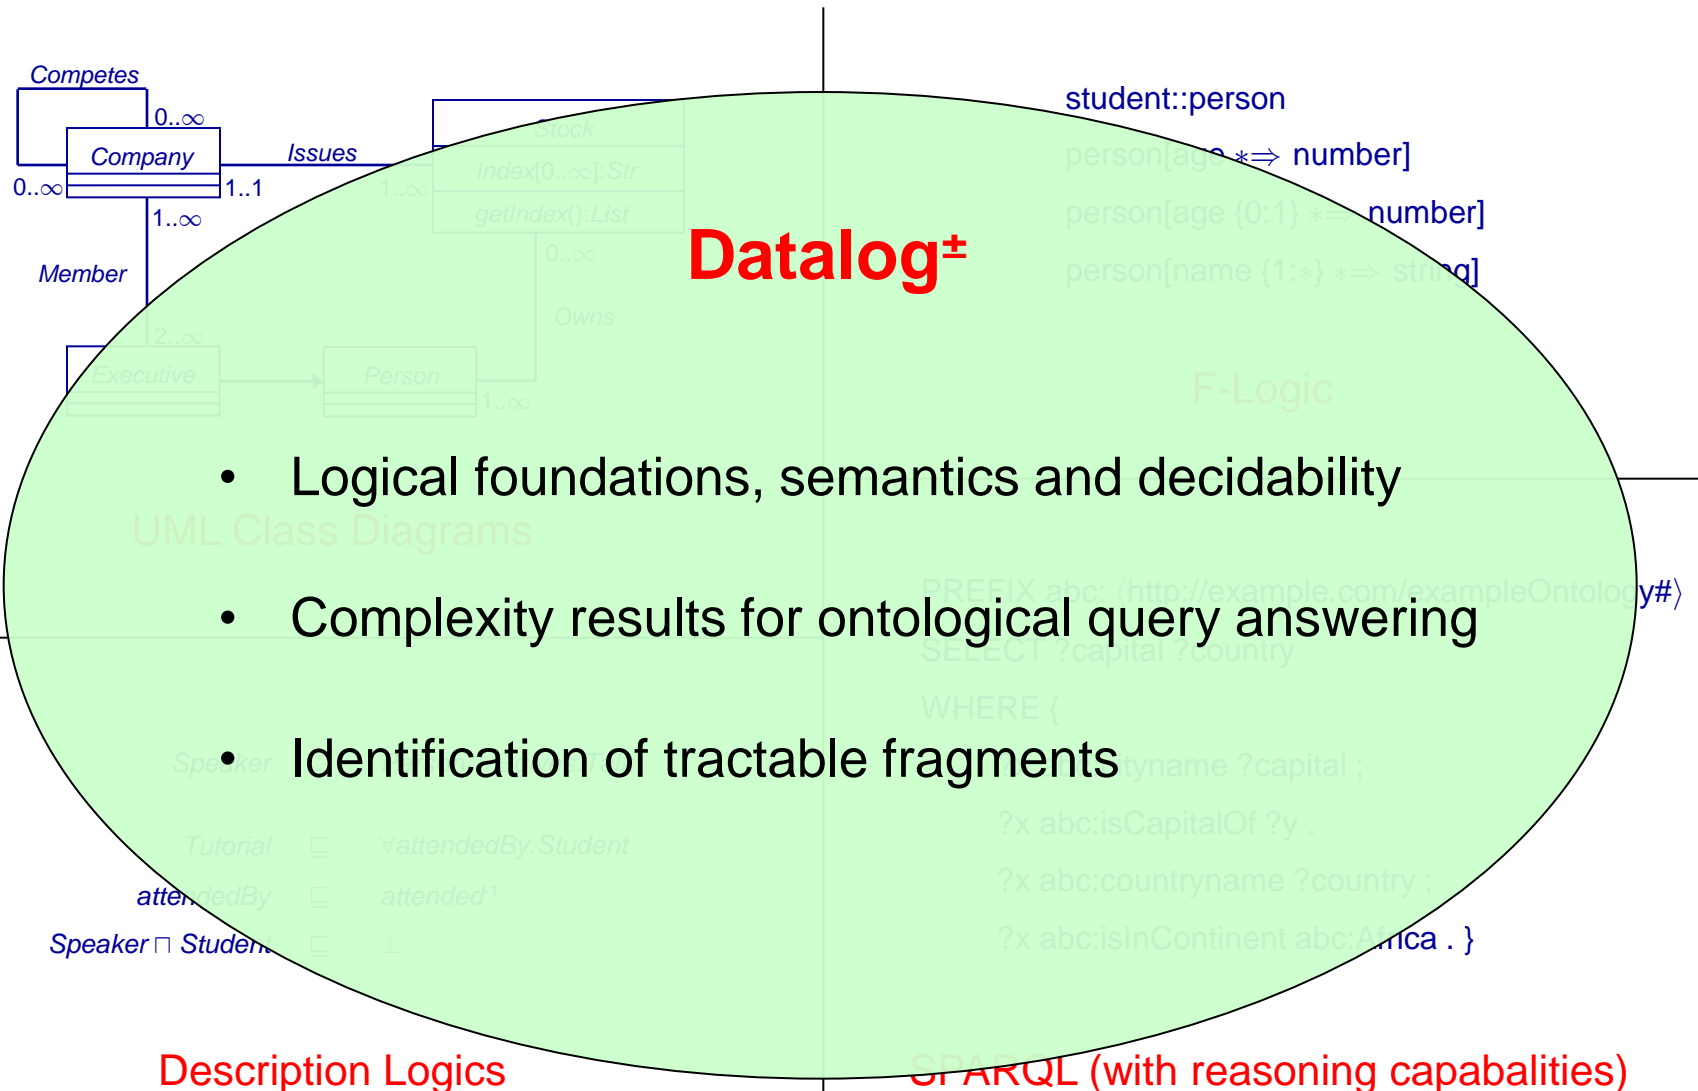

Description Logics

```

PREFIX abc: <http://example.com/exampleOntology#>
SELECT ?capital ?country
WHERE {
    ?x abc:cityname ?capital ;
    ?x abc:isCapitalOf ?y .
    ?x abc:countryname ?country ;
    ?x abc:isInContinent abc:Africa . }
  
```

SPARQL (with reasoning capabilities)

# A Unifying Framework for Ontology Querying

# The Datalog<sup>±</sup> Family

- **Datalog**:  $\forall X \forall Y \text{ fatherOf}(X, Y) \wedge \text{person}(Y) \rightarrow \text{person}(X)$

- **Extend Datalog** by allowing in the head:

Existential quantification (TGDs) –  $\forall X \text{ person}(X) \rightarrow \exists Y \text{ fatherOf}(Y, X) \wedge \text{person}(Y)$

Equality predicate (EGDs) –  $\forall X \forall Y \forall Z \text{ fatherOf}(Y, X) \wedge \text{fatherOf}(Z, X) \rightarrow Y = Z$

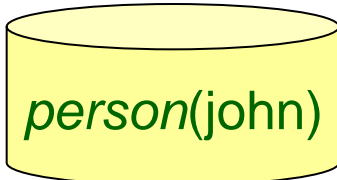

Constant false (Negative Constraints) –  $\forall X \forall Y \text{ fatherOf}(Y, X) \wedge \text{motherOf}(Y, X) \rightarrow \perp$

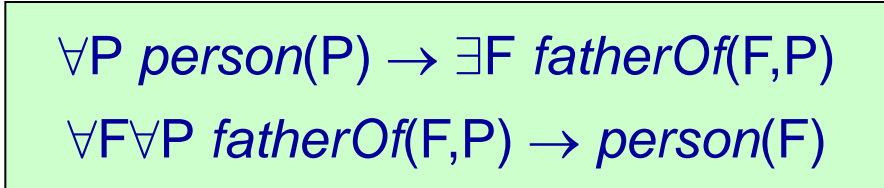

- But query answering under Datalog[ $\exists$ ] is already **undecidable**  
see, e.g., [Beeri & Vardi, **ICALP 1981**] and [Cali, G. & Kifer, **KR 2008**]
- Datalog[ $\exists, =, \perp$ ] is **syntactically restricted**  $\rightarrow$  **Datalog<sup>±</sup>**

# Ontological Query Answering

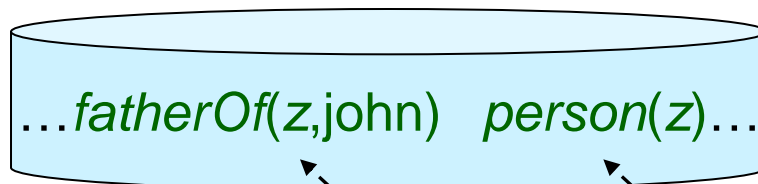

# Ontological Query Answering: Example

$D =$    $person(john)$

$O =$  

each model  
of  $\langle D, O \rangle$

$\supseteq$

  $\dots fatherOf(z, john) \quad person(z) \dots$

$\exists X \text{ fatherOf}(X, john) \wedge \text{person}(X)$  

$\exists X \text{ fatherOf}(john, X)$  

# Decidable Languages

- Guarded Datalog[ $\exists$ ]
- Linear Datalog[ $\exists$ ]
- Sticky Datalog[ $\exists$ ]

# Guarded Datalog[ $\exists$ ]

- All  $\forall$ -variables occur in one body atom – **guard atom**

$$\forall E \forall D \text{ employee}(E) \wedge \text{managerOf}(E, D) \rightarrow \exists F \text{ supervisorOf}(E, F)$$

  
**guard**

- Models of **finite treewidth**  $\Rightarrow$  decidability of query answering

[Calì, G. & Kifer, KR 2008, JAIR 2013] related to [Andréka, Németi & van Benthem, J. Philosophical Logic 1998] and [Grädel, J. Symb. Log. 1999]

- Query answering is **P**TIME-complete in data complexity

[Calì, G. & Kifer, KR 2008, JAIR 2013]

# Linear Datalog[ $\exists$ ]

- Rules with just **one body-atom**

$$\forall E \text{ supervisorOf}(E,E) \rightarrow \exists D \text{ managerOf}(E,D)$$

- Query answering is **first-order rewritable**
- Same data complexity as plain SQL queries (**in AC<sub>0</sub>**)

# Sticky Datalog[ $\exists$ ]

- Join-variables “stick” to the inferred atoms

- Query answering is **first-order rewritable**
- Same data complexity as plain SQL queries (in  $AC_0$ )

# Datalog[ $\exists, =, \perp$ ]

- Every decidable Datalog[ $\exists$ ] language can be enriched with:

- **Non-Conflicting EGDs** – no interaction with TGDs

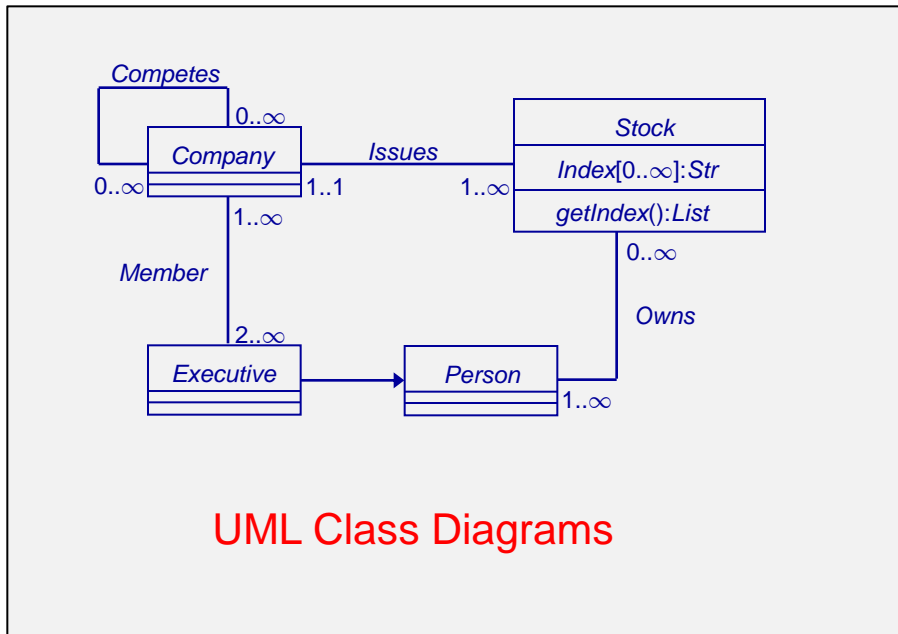

$$\forall X \forall Y \forall Z \text{ fatherOf}(Y, X) \wedge \text{fatherOf}(Z, X) \rightarrow Y = Z$$

- **Negative constraints**

$$\forall X \forall Y \text{ fatherOf}(Y, X) \wedge \text{motherOf}(Y, X) \rightarrow \perp$$

- The complexity of query answering **remains the same**

# A Unifying Framework for Ontology Querying

UML Class Diagrams

```

student::person
person[age *⇒ number]
person[age {0:1} *⇒ number]
person[name {1:*} *⇒ string]
  
```

F-Logic

```

Speaker ⊆ Person ⊓ ∃gives.Talk
Tutorial ⊆ ∀attendedBy.Student
attendedBy ⊆ attended1
Speaker ⊓ Student ⊆ ⊥
  
```

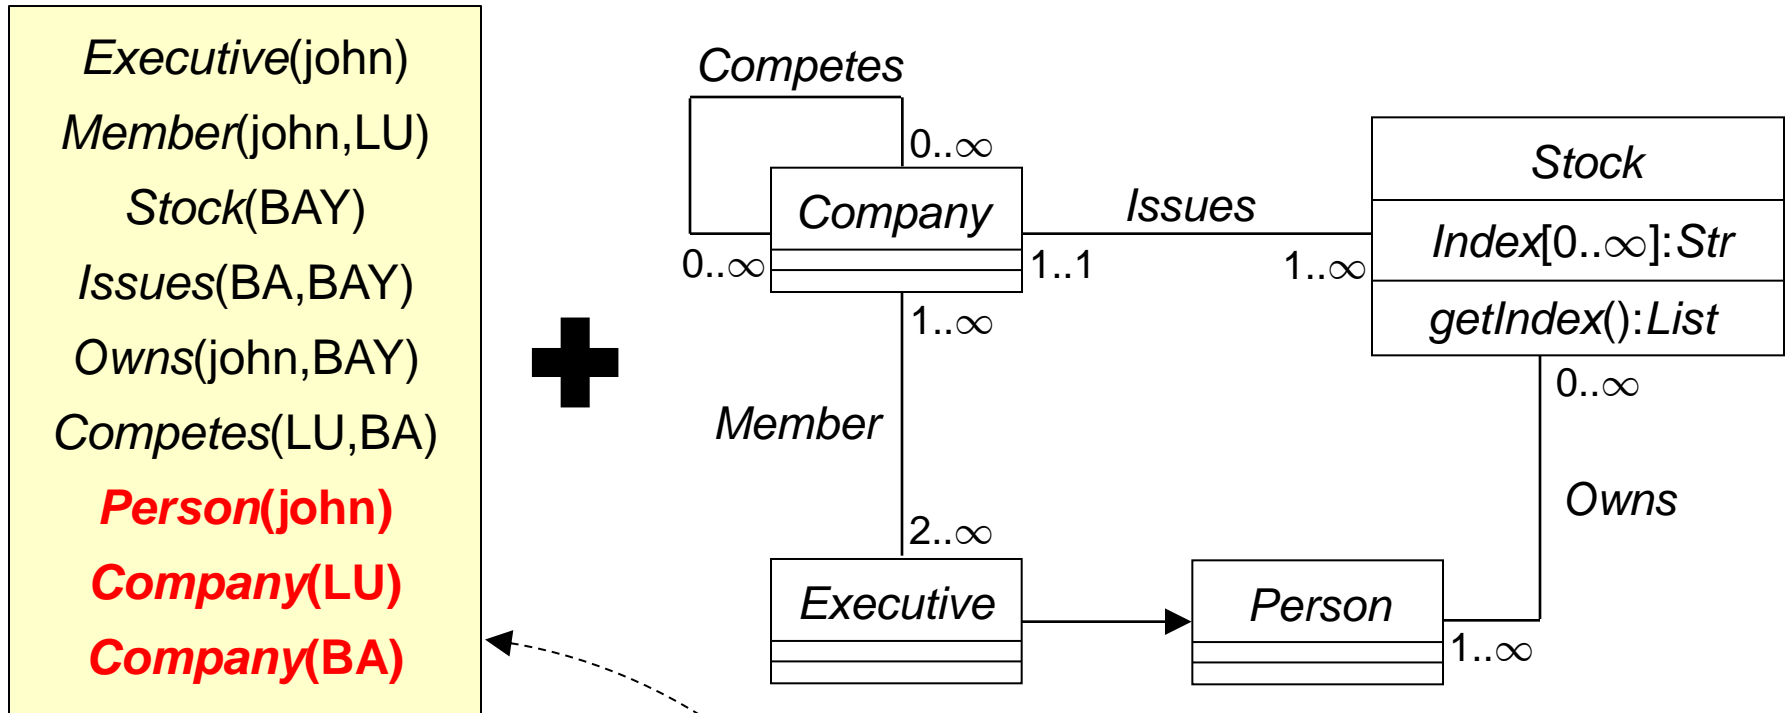

Description Logics

```

PREFIX abc: <http://example.com/exampleOntology#>
SELECT ?capital ?country
WHERE {
    ?x abc:cityname ?capital ;
    ?x abc:isCapitalOf ?y .
    ?x abc:countryname ?country ;
    ?x abc:isInContinent abc:Africa . }
  
```

SPARQL (with reasoning capabilities)

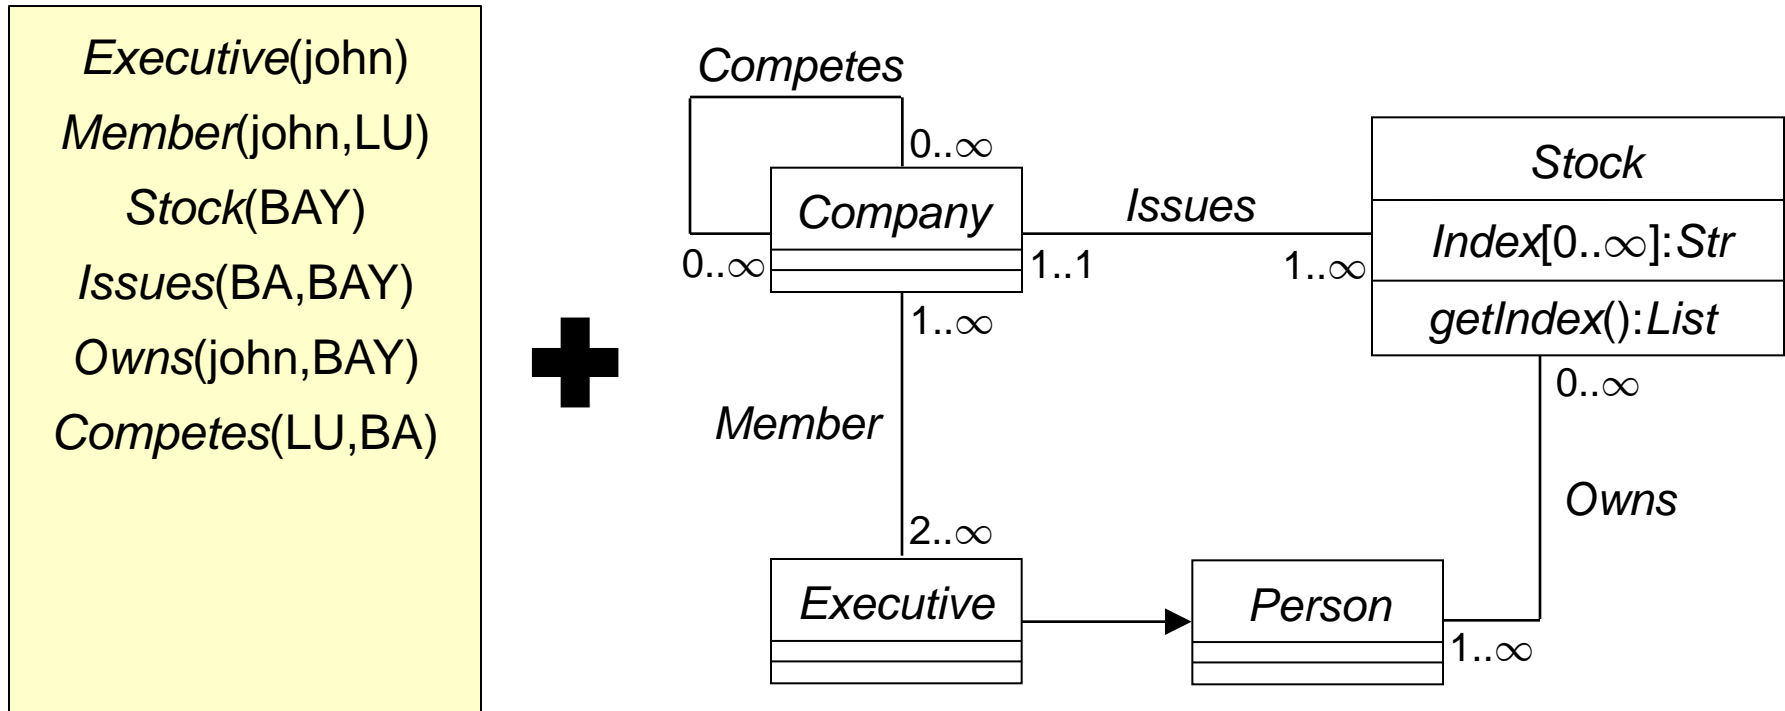

# Querying UML Class Diagrams: Example

Does anybody have a potential conflict of interest?

Conflict ← *Person*(P), *Company*(C<sub>1</sub>), *Company*(C<sub>2</sub>), *Stock*(S),  
*Owns*(P,S), *Member*(P,C<sub>1</sub>), *Issues*(C<sub>2</sub>,S), *Competes*(C<sub>1</sub>,C<sub>2</sub>) ✓

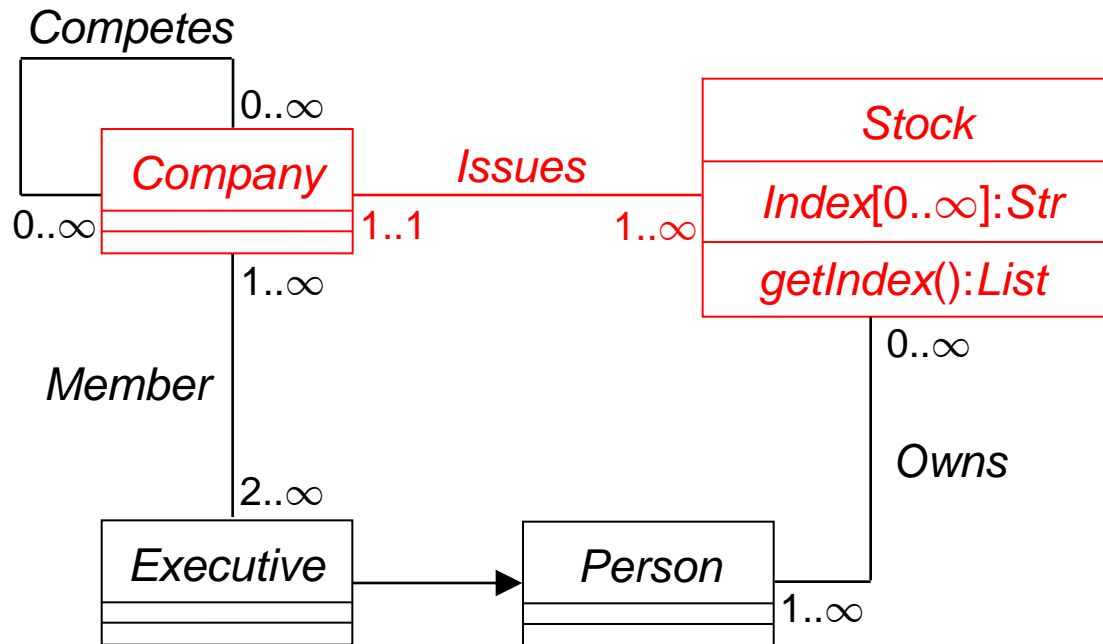

# Querying UML Class Diagrams: Example

Does anybody have a potential  
conflict of interest?

*Conflict* ← *Person(P), Company(C<sub>1</sub>), Company(C<sub>2</sub>), Stock(S),*  
*Owns(P,S), Member(P,C<sub>1</sub>), Issues(C<sub>2</sub>,S), Competes(C<sub>1</sub>,C<sub>2</sub>)*

# From Diagrams to First-Order Logic (Datalog<sup>±</sup>)

```

SPARQL (with reasoning capabilities)

# The DL-Lite Family

Popular family of DLs with  $AC_0$  data complexity

DL-Lite TBox	First-Order Representation (Datalog $^\pm$ )
<p><b>DL-Lite<sub>core</sub></b></p> <p><math>professor \sqsubseteq \exists teachesTo</math></p> <p><math>professor \sqsubseteq \neg student</math></p>	<p><math>\forall X \text{ professor}(X) \rightarrow \exists Y \text{ teachesTo}(X,Y)</math></p> <p><math>\forall X \text{ professor}(X) \wedge \text{ student}(X) \rightarrow \perp</math></p>
<p><b>DL-Lite<sub>R</sub> (OWL 2 QL)</b></p> <p><math>hasTutor^- \sqsubseteq teachesTo</math></p>	<p><math>\forall X \forall Y \text{ hasTutor}(X,Y) \rightarrow \text{ teachesTo}(Y,X)</math></p>
<p><b>DL-Lite<sub>F</sub></b></p> <p><math>funct(hasTutor)</math></p>	<p><math>\forall X \forall Y \forall Z \text{ hasTutor}(X,Y) \wedge \text{ hasTutor}(X,Z) \rightarrow Y = Z</math></p>

# The $\mathcal{EL}$ Family

Popular family of DLs with **PTIME** data complexity (**OWL 2 EL**)

$\mathcal{ELHI}^-$ TBox	First-Order Representation (Datalog $^\pm$ )
$A \sqcap B \sqsubseteq C$	$\forall X \ A(X) \wedge B(X) \rightarrow C(X)$
$A \sqsubseteq \exists R$	$\forall X \ A(X) \rightarrow \exists Y \ R(X, Y)$
$A \sqsubseteq \exists R.B$	$\forall X \ A(X) \rightarrow \exists Y \ R(X, Y) \wedge B(Y)$
$\exists R \sqsubseteq A$	$\forall X \forall Y \ R(X, Y) \rightarrow A(X)$
$\exists R.A \sqsubseteq B$	$\forall X \forall Y \ R(X, Y) \wedge A(X) \rightarrow B(Y)$
$A \sqsubseteq \neg B$	$\forall X \ A(X) \wedge B(X) \rightarrow \perp$
$R \sqsubseteq \neg P$	$\forall X \forall Y \ R(X, Y) \wedge P(X, Y) \rightarrow \perp$

see, e.g., [Baader, **IJCAI 2003**], [Rosati, **DL 2007**] and [Pérez-Urbina et al., **J. Applied Logic 2010**]

# DLs vs. Datalog[ $\exists, =, \perp$ ]

- **Theorem:** For query answering,

DL-Lite  $\leq_L$  Linear and Sticky

$\mathcal{ELHI}^\neg \leq_L$  Guarded

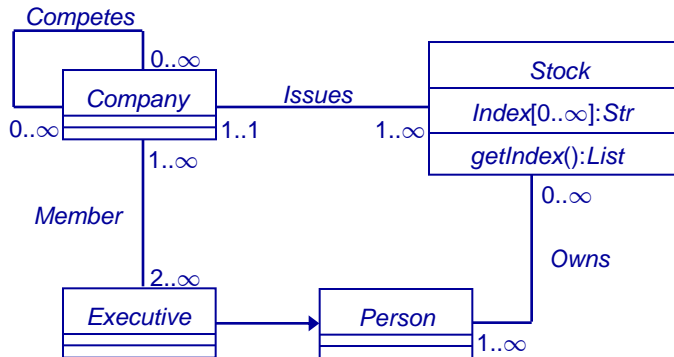

- **Theorem:** Guarded/Linear/Sticky are **strictly more expressive**

$\forall E \text{ ceo}(E) \rightarrow \text{managerOf}(E, E)$

$\forall E \text{ supervisorOf}(E, E) \rightarrow \exists D \text{ managerOf}(E, D)$

- **Remark:** the data complexity is **preserved**

# A Unifying Framework for Ontology Querying

SPARQL (with reasoning capabilities)

# SPARQL Protocol and RDF Query Language

- **RDF** – data model for representing information in the Web
- ... in fact, is a finite set of triples (*subject, predicate, object*) – or a relational database for the schema *{triple(.,.,.)}*
- **SPARQL** – the standard language for querying RDF data

# Some SPARQL Queries

- $P = (?X, \text{name}, ?Y)$  – list of pairs  $(o_1, o_2)$  such as  $o_2$  is the name of  $o_1$
- $P = (?X, \text{name}, B)$  – list of elements that have a name
- $P = (?X, \text{name}, ?Y) \text{ OPT } (?X, \text{phone}, ?Y)$  – for every subject  $o$ , return  $o$ , the name of  $o$ , and the phone number of  $o$ , if the phone number is available; otherwise, return  $o$  and its name

# From SPARQL to First-Order Logic (Datalog<sup>±</sup>)

$P = (?X, \text{name}, ?Y)$  – list of pairs  $(o_1, o_2)$  such as  $o_2$  is the name of  $o_1$

$$\forall X \forall Y \text{ triple}(X, \text{name}, Y) \rightarrow P(X, Y)$$

# From SPARQL to First-Order Logic (Datalog<sup>±</sup>)

$P = (?X, \text{name}, B)$  – list of elements that have a name

$$\forall X \forall Y \text{ triple}(X, \text{name}, Y) \rightarrow P(X)$$

# From SPARQL to First-Order Logic (Datalog<sup>±</sup>)

$P = (?X, \text{name}, ?Y) \text{ OPT } (?X, \text{phone}, ?Y)$  – for every subject  $o$ , return  $o$ , the name of  $o$ , and the phone number of  $o$ , if the phone number is available; otherwise, return  $o$  and its name

list of individuals with phone number

$\forall X \forall Y \text{ triple}(X, \text{name}, Y) \wedge \text{triple}(X, \text{phone}, Z) \rightarrow P(X, Y, Z) \wedge \text{compatible}(Z)$

the third argument (i.e., the phone no.) is missing

$\forall X \forall Y \text{ triple}(X, \text{name}, Y) \wedge \neg \text{compatible}(X) \rightarrow P'(X, Y)$

# From SPARQL to First-Order Logic (Datalog<sup>±</sup>)

$P = (?X, \text{name}, ?Y) \text{ OPT } (?X, \text{phone}, ?Y)$  – for every subject  $o$ , return  $o$ , the name of  $o$ , and the phone number of  $o$ , if the phone number is available; otherwise, return  $o$  and its name

$$\forall X \forall Y \text{ triple}(X, \text{name}, Y) \wedge \text{triple}(X, \text{phone}, Z) \rightarrow P(X, Y, Z) \wedge \text{compatible}(Z)$$

$$\forall X \forall Y \text{ triple}(X, \text{name}, Y) \wedge \neg \text{compatible}(X) \rightarrow P'(X, Y)$$

**Non-guarded** rules, and also **negation** is needed

# From SPARQL to First-Order Logic (Datalog<sup>±</sup>)

$P = (?X, \text{name}, ?Y) \text{ OPT } (?X, \text{phone}, ?Y)$  – for every subject  $o$ , return  $o$ , the name of  $o$ , and the phone number of  $o$ , if the phone number is available; otherwise, return  $o$  and its name

$$\forall X \forall Y \text{ triple}(X, \text{name}, Y) \wedge \text{triple}(X, \text{phone}, Z) \rightarrow P(X, Y, Z) \wedge \text{compatible}(Z)$$

$$\forall X \forall Y \text{ triple}(X, \text{name}, Y) \wedge \neg \text{compatible}(X) \rightarrow P'(X, Y)$$

**Non-guarded** rules, and also **negation** is needed

**Stratified Weakly-Guarded Datalog $[\exists, \neg, \perp]$**

# Additional Functionalities

- **Reasoning capabilities** – deal with RDFS and OWL vocabularies
- **Navigational capabilities** – exploit the graph structure of RDF data
- General form of **recursion** – express natural queries

**Theorem:** Stratified weakly-guarded Datalog[ $\exists, \neg, \perp$ ] is **strictly more expressive** than SPARQL enriched with the above functionalities  
(under the the OWL 2 QL and OWL 2 RL profiles of OWL 2)

# Overview

Formalism	Datalog <sup>±</sup> Language
Lean UML Class Diagrams	Guarded Datalog[ $\exists, =, \perp$ ]
DL-Lite (OWL 2 QL)	Linear and Sticky Datalog[ $\exists, =, \perp$ ]
<i>ELHI</i> <sup>¬</sup> (OWL 2 EL)	Guarded Datalog[ $\exists, \perp$ ]
F-Logic Lite	Weakly-Guarded Datalog[ $\exists, =$ ] + PCC
SPARQL (with additional features)	Stratified Weakly-Guarded Datalog[ $\exists, \neg, \perp$ ]

# Implementation

- **IRIS<sup>±</sup>** – Query rewriting engine for Linear and Sticky Datalog[ $\exists$ ]
  - Developed at the University of Oxford
  - Several **effective optimizations** towards compact rewritings
  - Supports **parallel rewriting**
  - **Database execution** via SQL rewriting
  - Fully open source – <https://bitbucket.org/giorsi/nyaya>

# Other Engines for Datalog<sup>±</sup>

- **ALASKA** – Query rewriting engine for Linear and Sticky Datalog[ $\exists$ ]
  - Developed at the University of Montpellier

a language which captures Linear Datalog[ $\exists$ ] and plain Datalog

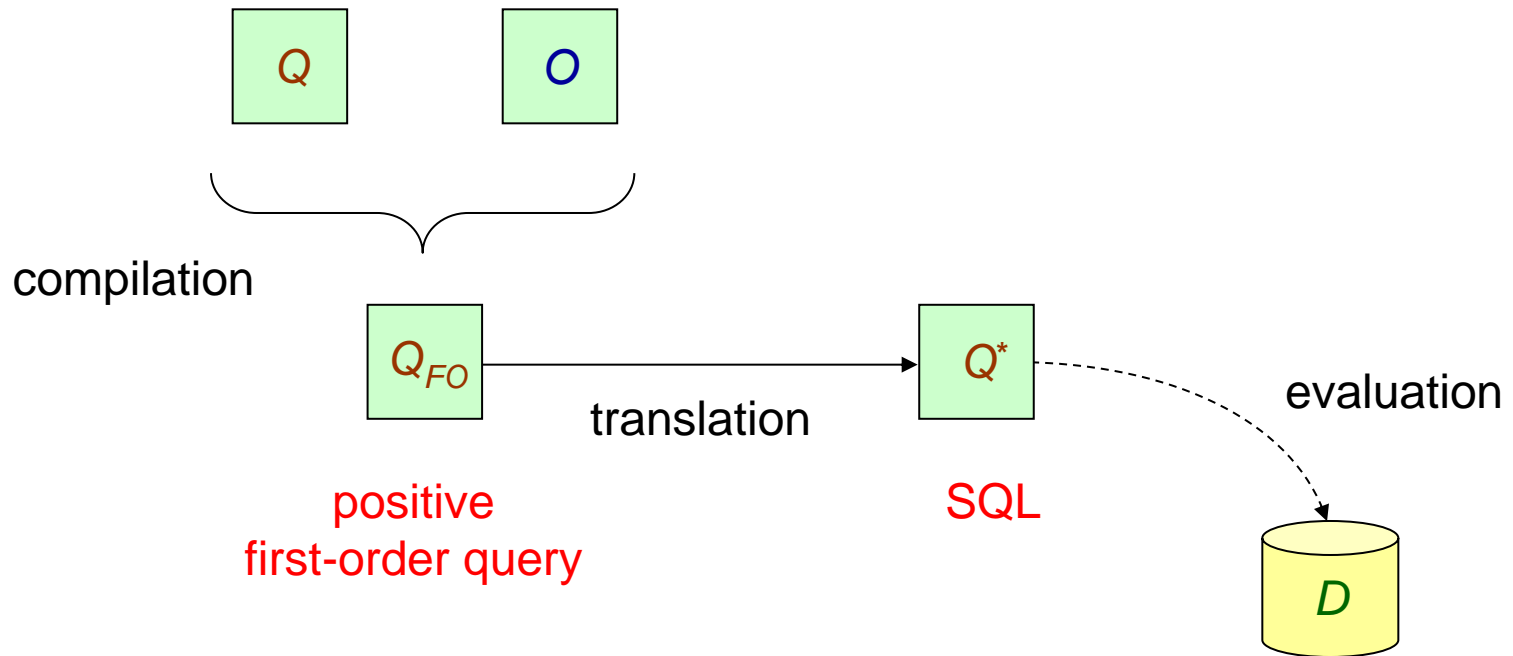

- **DLV $\exists$**  – Query answering engine for Shy Datalog[ $\exists$ ]
  - Developed at the University of Calabria
  - Extension of the DLV engine

Thank you!

# APPENDIX

# First-Order Rewritability

$$\forall D (D \cup O \models Q \iff D \models Q^*)$$

Query answering is in  $AC_0$  in data complexity

# The DL-Lite Family

Popular family of DLs with  $AC_0$  data complexity

$B ::= A \mid \exists R \mid \exists R^{-1}$  (basic concept)

$C ::= B \mid \neg B$  (general concept)

$R ::= P \mid P^{-1}$  (basic role)

$E ::= R \mid \neg R$  (general role)

# The $\mathcal{EL}$ Family

Popular family of DLs with **PTIME** data complexity (**OWL 2 EL**)

see, e.g., [Baader, *IJCAI 2003*], [Rosati, *DL 2007*] and [Pérez-Urbina et al., *J. Applied Logic 2010*]

# Weakly-Guarded Datalog[ $\exists$ ]

- All  $\forall$ -variables at **affected positions** occur in one body atom

  
**null** can occur  
 during the chase

$$\forall X \forall Y \ S(X, Y) \wedge P(X, Y) \rightarrow \exists Z \ P(Y, Z)$$

$$\forall X \forall Y \forall W \ P(X, Y) \wedge P(W, X) \rightarrow S(Y, X)$$

Affected positions = ?

# Weakly-Guarded Datalog[ $\exists$ ]

- All  $\forall$ -variables at **affected positions** occur in one body atom

  
**null** can occur  
 during the chase

$$\forall X \forall Y \ S(X, Y) \wedge P(X, Y) \rightarrow \exists Z \ P(Y, Z)$$

$$\forall X \forall Y \forall W \ P(X, Y) \wedge P(W, X) \rightarrow S(Y, X)$$

Affected positions =  $\{P[2]\}$

# Weakly-Guarded Datalog[ $\exists$ ]

- All  $\forall$ -variables at **affected positions** occur in one body atom

  
**null** can occur  
 during the chase

$$\forall X \forall Y \ S(X, Y) \wedge P(X, Y) \rightarrow \exists Z \ P(Y, Z)$$

$$\forall X \forall Y \forall W \ P(X, Y) \wedge P(W, X) \rightarrow S(Y, X)$$

Affected positions =  $\{P[2], S[1]\}$

# Weakly-Guarded Datalog[ $\exists$ ]

- All  $\forall$ -variables at **affected positions** occur in one body atom

  
**null** can occur  
 during the chase

$$\forall X \forall Y \quad \mathbf{S(X,Y)} \wedge P(X,Y) \rightarrow \exists Z P(Y,Z)$$

$$\forall X \forall Y \forall W \quad \mathbf{P(X,Y)} \wedge P(W,X) \rightarrow S(Y,X)$$

Affected positions =  $\{P[2], S[1]\}$

# Frame Logic (F-Logic)

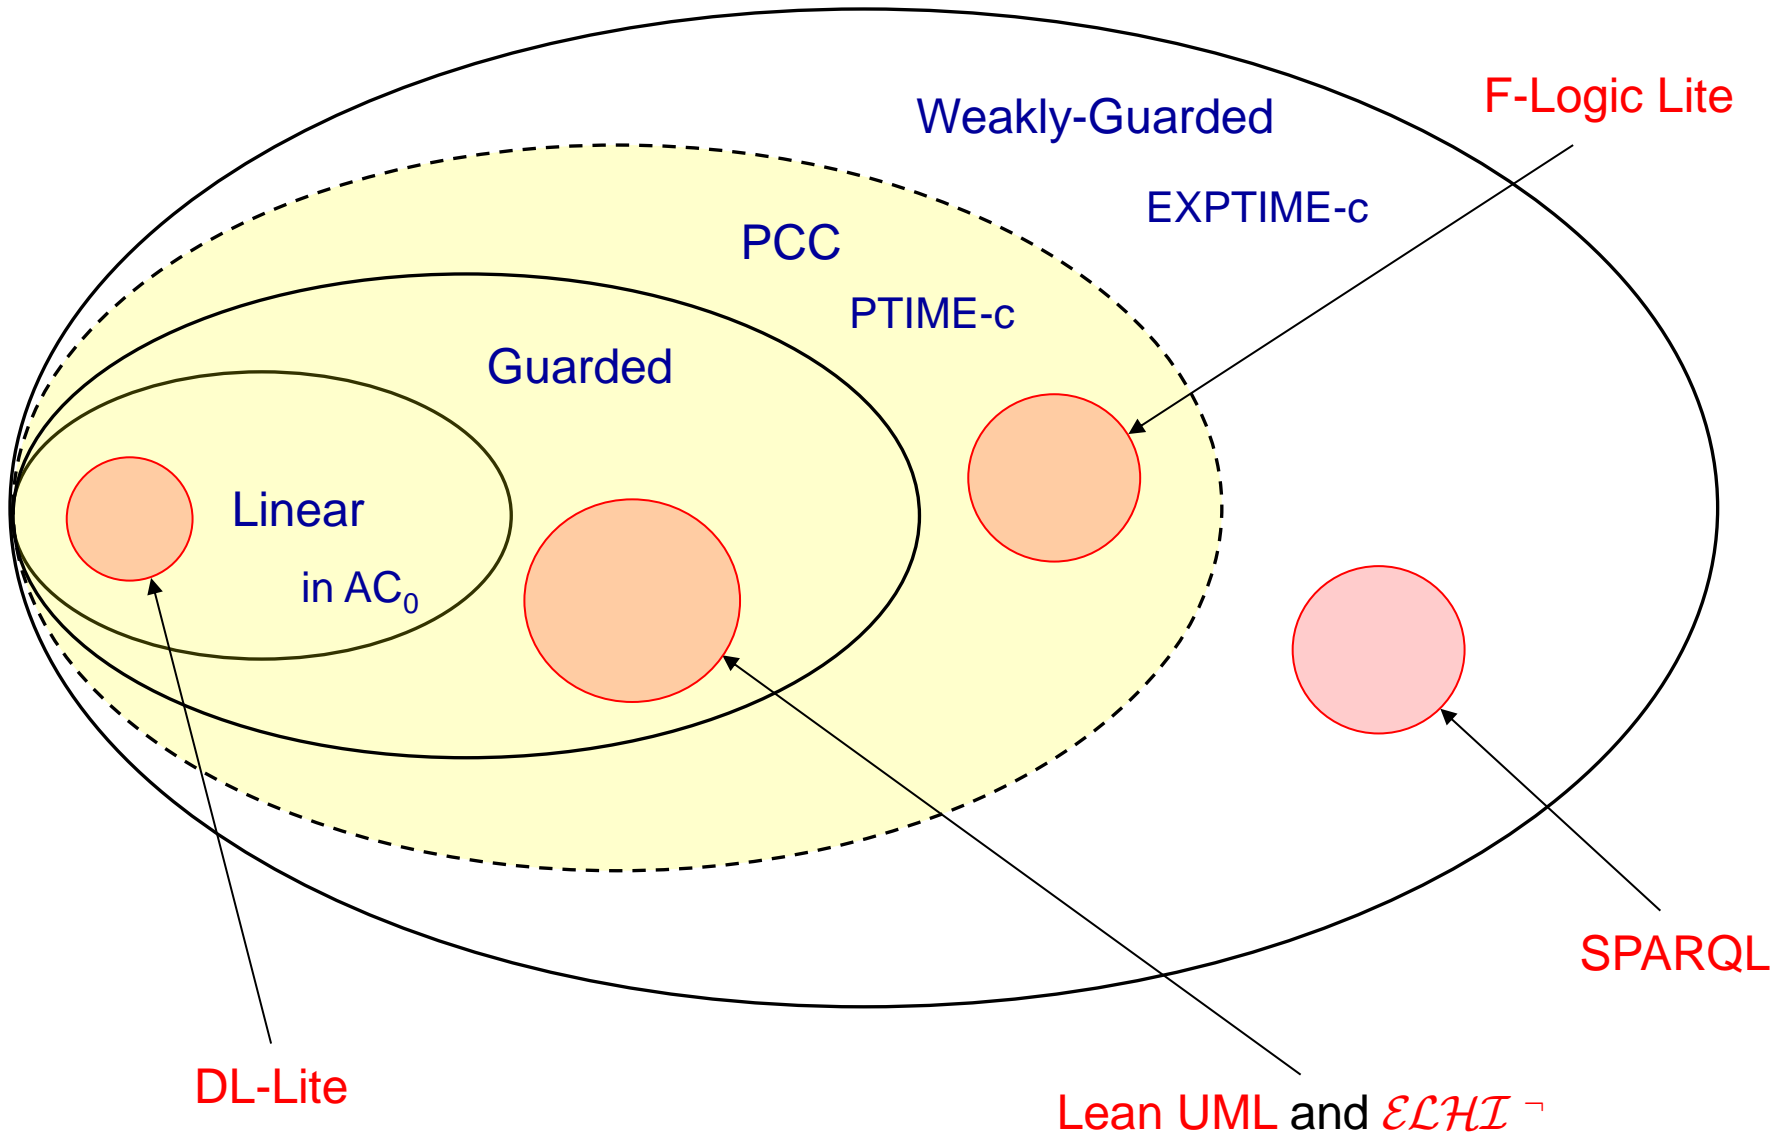

- Originally developed for **object-oriented deductive databases**
- Now used as an ontology language – **Semantic Web**
- F-Logic is in general **undecidable**

# F-Logic Lite

- An expressive **decidable fragment** of F-Logic
- Obtained from F-Logic by:
  - Excluding negation and default inheritance
  - Allowing only a limited form of cardinality constraints
- Query answering is **PTIME-complete** in data complexity

# Overview

# Complexity of Datalog $[\exists, =, \neg, \perp]$

	Linear	Guarded	Weakly-Guarded	
Arbitrary Query	PSPACE-c	2EXPTIME-c	2EXPTIME-c	Arbitrary Program
Fixed/Atomic Query	PSPACE-c	2EXPTIME-c	2EXPTIME-c	
Arbitrary Query	NP-c	NP-c	EXPTIME-c	Fixed Program
Fixed/Atomic Query	in AC <sub>0</sub>	PTIME-c	EXPTIME-c	

# Complexity of Datalog $[\exists, =, \neg, \perp]$

	Linear	Guarded	Weakly-Guarded	
Arbitrary Query	PSPACE-c	2EXPTIME-c	2EXPTIME-c	Arbitrary Program
Fixed/Atomic Query	PSPACE-c	2EXPTIME-c	2EXPTIME-c	
Arbitrary Query	NP-c	NP-c	EXPTIME-c	Fixed Program
Fixed/Atomic Query	in AC <sub>0</sub>	PTIME-c	EXPTIME-c	

**Data Complexity**

# Complexity of Datalog $[\exists, =, \neg, \perp]$

	Linear	Guarded	Weakly-Guarded	
Arbitrary Query	PSPACE-c	2EXPTIME-c	2EXPTIME-c	Arbitrary Program
Fixed/Atomic Query	PSPACE-c	2EXPTIME-c	2EXPTIME-c	
Arbitrary Query	NP-c	NP-c	NP-c	Fixed Program
Fixed/Atomic Query	in AC <sub>0</sub>	PTIME-c	PTIME-c	

**Polynomial Cloud Criterion**
