

The RuleML Perspective on Deliberation-Reaction Standards

Adrian Paschke, Harold Boley, Tara Athan

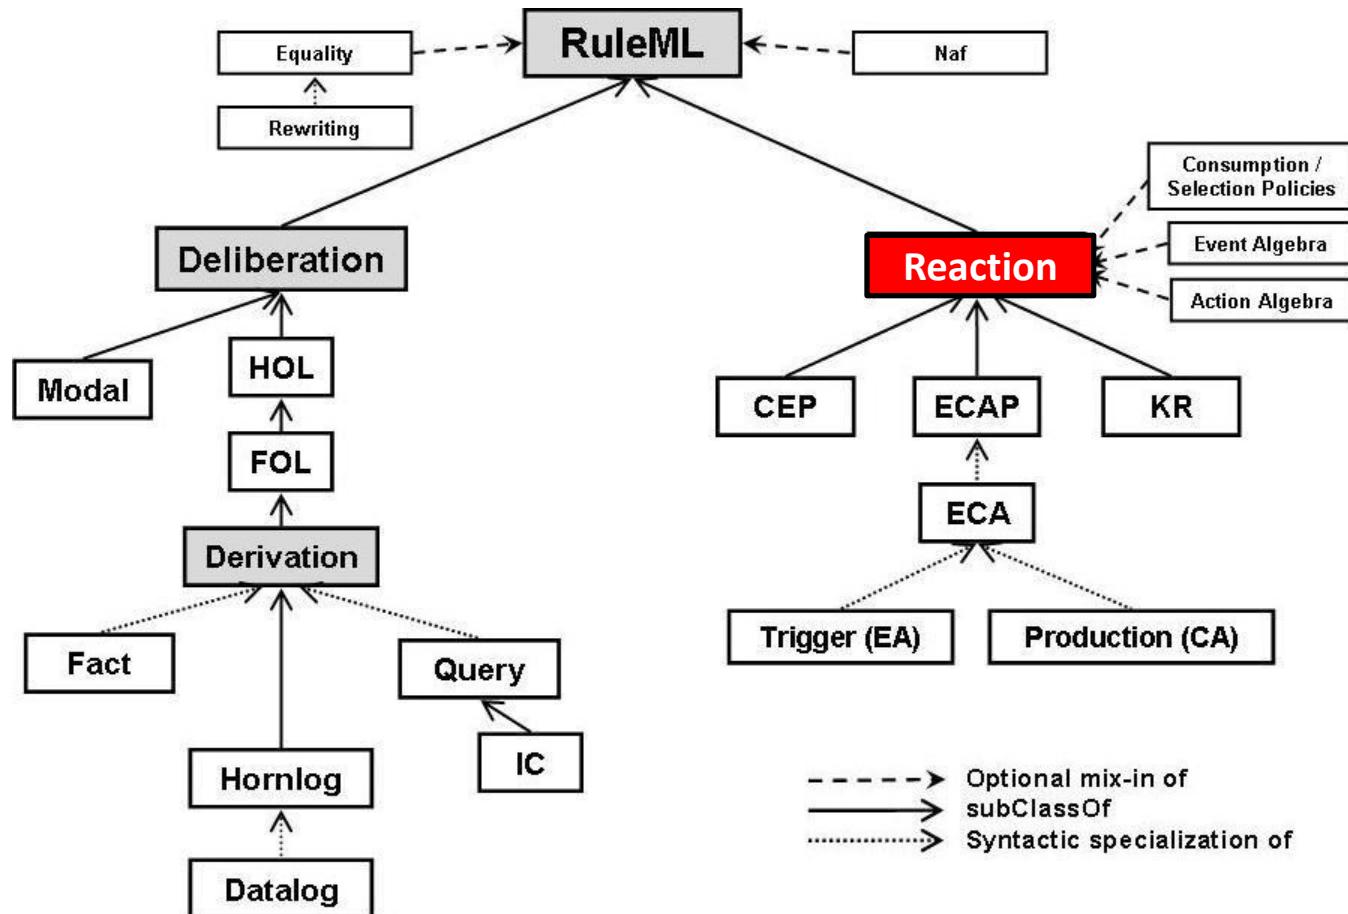

In Ontolog RulesReasoningLP: Series Session 5
9 January 2014

Agenda

- Reaction RuleML
- Semantic Profiles
- Semantic Metamodel and External Ontologies (Semantic Sorts)
- Syntactic Customization

The RuleML Family

Reaction RuleML 1.0 Paper: http://link.springer.com/chapter/10.1007%2F978-3-642-32689-9_9

Reaction RuleML 1.0 Tutorial: <http://www.slideshare.net/swadpasc/reaction-ruleml-ruleml2012paschketutorial>

RuleML 1.0 Paper http://link.springer.com/chapter/10.1007/978-3-642-16289-3_15

RuleML Overview Slides: <http://cs.unb.ca/~boley/talks/RuleML-Overarching-Talk.pdf>

Reaction Rules: Four Sub-branches

- **PR** Production Rules
(Condition-Action rules)
- **ECA** Event-Condition-Action (ECA) rules
- **CEP** Rule-based Complex Event Processing (complex event processing reaction rules, (distributed) event messaging reaction rules, query reaction rules, etc.)
- **DR and KR** Knowledge Representation [AI Reasoning](#) with Temporal/Event/Action/Situation/Transition/Process Logics and Calculi

Quick Overview: Reaction RuleML Dialects

* + variants and alternatives

- **Spatio-Temporal Derivation RuleML (*if-then*)^{*}**
 - Time, Spatial, Interval
- **KR RuleML (*if-then* or *on-if-do*)^{*}**
 - Situation, Happens_(@type), Initiates, Terminates, Holds, fluent
- **Production RuleML (*if-do*)^{*}**
 - Assert, Retract, Update, Action
- **ECA RuleML (*on-if-do*)^{*}**
 - Event, Action, + (event / action algebra operators)
- **CEP (arbitrary combination of *on*, *if*, *do*)**
 - Receive, Send, Message

(Reaction) Rules: Specializable Syntax

<Rule @key @keyref @style>		
Info, Life Cycle Mgt.	<meta> <!-- descriptive metadata of the rule -->	</meta>
Interface	<scope> <!-- scope of the rule e.g. a rule module -->	</scope>
	<evaluation> <!-- intended semantics -->	</evaluation>
	<signature> <!-- rule signature -->	</signature>
	<qualification> <!-- e.g. qualifying rule metadata, e.g. priorities, validity, strategy -->	</qualification>
	<quantification> <!-- quantifying rule declarations, e.g. variable bindings -->	</quantification>
Imple- mentation	<oid> <!-- object identifier -->	</oid>
	<on> <!-- event part -->	</on>
	<if> <!-- condition part -->	</if>
	<then> <!-- (logical) conclusion part -->	</then>
	<do> <!-- action part -->	</do>
	<after> <!-- postcondition part after action, e.g. to check effects of execution -->	</after>
	<else> <!-- (logical) else conclusion -->	</else>
	<elsedo> <!-- alternative/else action, e.g. for default handling -->	</elsedo>
	</Rule>	

Reaction RuleML – Example Rule Types

- **Derivation Rule:**
(temporal/event/action/situation reasoning)

```
<Rule style="reasoning">
    <if>...</if>
    <then>...</then>
</Rule>
```
- **Production Rule:**

```
<Rule style="active">
    <if>...</if>
    <do>...</do>
</Rule>
```
- **Trigger Rule:**

```
<Rule style="active"> >
    <on>...</on>
    <do>...</do>
</Rule>
```
- **ECA Rule:**

```
<Rule style="active">
    <on>...</on>
    <if>...</if>
    <do>...</do>
</Rule>
```

Agenda

- Reaction RuleML
- Semantic Profiles
- Semantic Metamodel and External Ontologies (Semantic Sorts)
- Syntactic Customization

Integration of Semantic Profiles

1. Include/Import external Semantic Profile

```
<xi:include href="../../profiles/SituationCalculusProfile.rrml" xpointer="xpointer(/RuleML/*)"/>
<evaluation>
  <Profile keyref="&ruleml;ReifiedClassicalSituationCalculus" />
</evaluation>
```

2. Reference pre-defined Semantic Profile as profile type

```
<evaluation>
  <Profile type="&rif;RDFS" iri="http://www.w3.org/ns/entailment/RDFS"/>
</evaluation>
```

Reference published
external semantic profiles,
e.g. RIF, OWL, profiles ...

3. Locally defined Semantic Profile

```
<Assert>
  <evaluation>
    <Profile key="&ruleml;ReifiedClassicalSituationCalculus" >
      <formula><Rulebase> ... RuleML definition... </Rulebase></formula>
      <content> ... xs:any XML content, e.g. RIF, Common Logic XML... </content>
    </Profile>
  </evaluation>
  <Rulebase>
    <Rule> ... </Rule>
    <Rule> ... </Rule>
  </Rulebase>
</Assert>
```

Note: also other non
RuleML content models are
supported

Example – Reified Situation Calculus Axioms

- (1) $\forall(A1, A2, S1, S2) (\text{do}(A1, S1) = \text{do}(A2, S2)) \rightarrow (A1 = A2)$
- (2) $\forall(S1, S2, A) (S1 < \text{do}(A, S2)) \equiv (S1 \leq S2)$
- (3) $\forall(S1, S2) (S1 \leq S2) \equiv (S1 < S2) \vee (S1 = S2)$
- (4) $\forall(S1, S2) (S1 < S2) \rightarrow \neg(S2 < S1)$
- (5) $\forall(F, s) [\text{holds}(F, s_0) \wedge (\forall(A) (\text{holds}(F, s) \rightarrow \text{holds}(F, \text{do}(A, s))))] \rightarrow \text{holds}(F, s)$
- (6) $\neg S < s_0$

...

Example: Axiomatization of Situation Calculus Profile in RuleML

```
<Assert>
  <evaluation>
    <Profile key="&ruleml;ReifiedSituationCalculus"> <!-- Profile key can be referenced by keyref -->
      <Rulebase key="&ruleml;ReifiedSituationCalculusBasicAxioms">
        <!-- Forall(A1, A2, S1, S2) (do(A1,S1) = do(A2,S2)) => (A1 = A2) -->
        <Rule key="&ruleml;SituationCalculusBasicAxiom1">
          <quantification> <Forall>
            <declare><Var>A1</Var></declare> <declare><Var>A2</Var></declare>
            <declare><Var>S1</Var></declare> <declare><Var>S2</Var></declare>
            </Forall> </quantification>
          <if>
            <Equal>
              <Situation>
                <Do> <Action><Var>A1</Var></Action><Situation><Var>S1</Var></Situation> </Do>
              </Situation>
              <Situation>
                <Do> <Action><Var>A2</Var></Action><Situation><Var>S2</Var></Situation></Do>
              </Situation>
            </Equal>
          </if>
          <then>
            <Equal> <Action><Var>A1</Var></Action> <Action><Var>A2</Var></Action> </Equal>
          </then>
        </Rule>
        ...
      </Profile>
    </evaluation>
  </Assert>
```

Complex Event Processing – Semantic Profiles

(defined in `<evaluation>` semantic profiles)

1. Definition

- Definition of event/action pattern e.g. by event algebra
- Based on declarative formalization or procedural implementation
- Defined over an atomic instant or an interval of time, events/actions, situation, transition etc.

2. Selection

- Defines selection function to select one event from several occurred events (stored in an event instance sequence e.g. in memory, database/KB) of a particular type, e.g. “*first*”, “*last*”
- Crucial for the outcome of a reaction rule, since the events may contain different (context) information, e.g. different message payloads or sensing information

3. Consumption

- Defines which events are consumed after the detection of a complex event
- An event may contribute to the detection of several complex events, if it is not consumed
- Distinction in event messaging between “multiple receive” and “single receive”
- Events which can no longer contribute, e.g. are outdated, should be removed

4. Execution

- Actions might have an internal effect i.e. change the knowledge state leading to state transition from (pre-)condition state to post-condition state
- The effect might be hypothetical (e.g. a hypothetical state via a computation) or persistent (update of the knowledge base),
- Actions might have an external side effect

Example - Reaction Rules with Semantic Profiles

```
<Rule style="active">
  <evaluation>
    <Profile> e.g. selection and consumptions policies </Profile>
  </evaluation>
  <signature>
    <Event key="#ce1">
      ... event pattern definition (for event detection)
    </Event>
  </signature>
```

```
<on>
  <Event keyref="#ce1"/> <!-- use defined event pattern for detecting events -->
</on>
```

```
<if>
  ...
</if>
<do>
```

```
  <Assert safety="transactional"> <!-- transactional update -->
```

```
    <formula>
      <Atom>
        ....
      </Atom>
    </formula>
```

```
  </Assert>
</do>
```

```
</Rule>
```

Interface

(semantic profile +
event pattern
signature for event
processing /
detection)

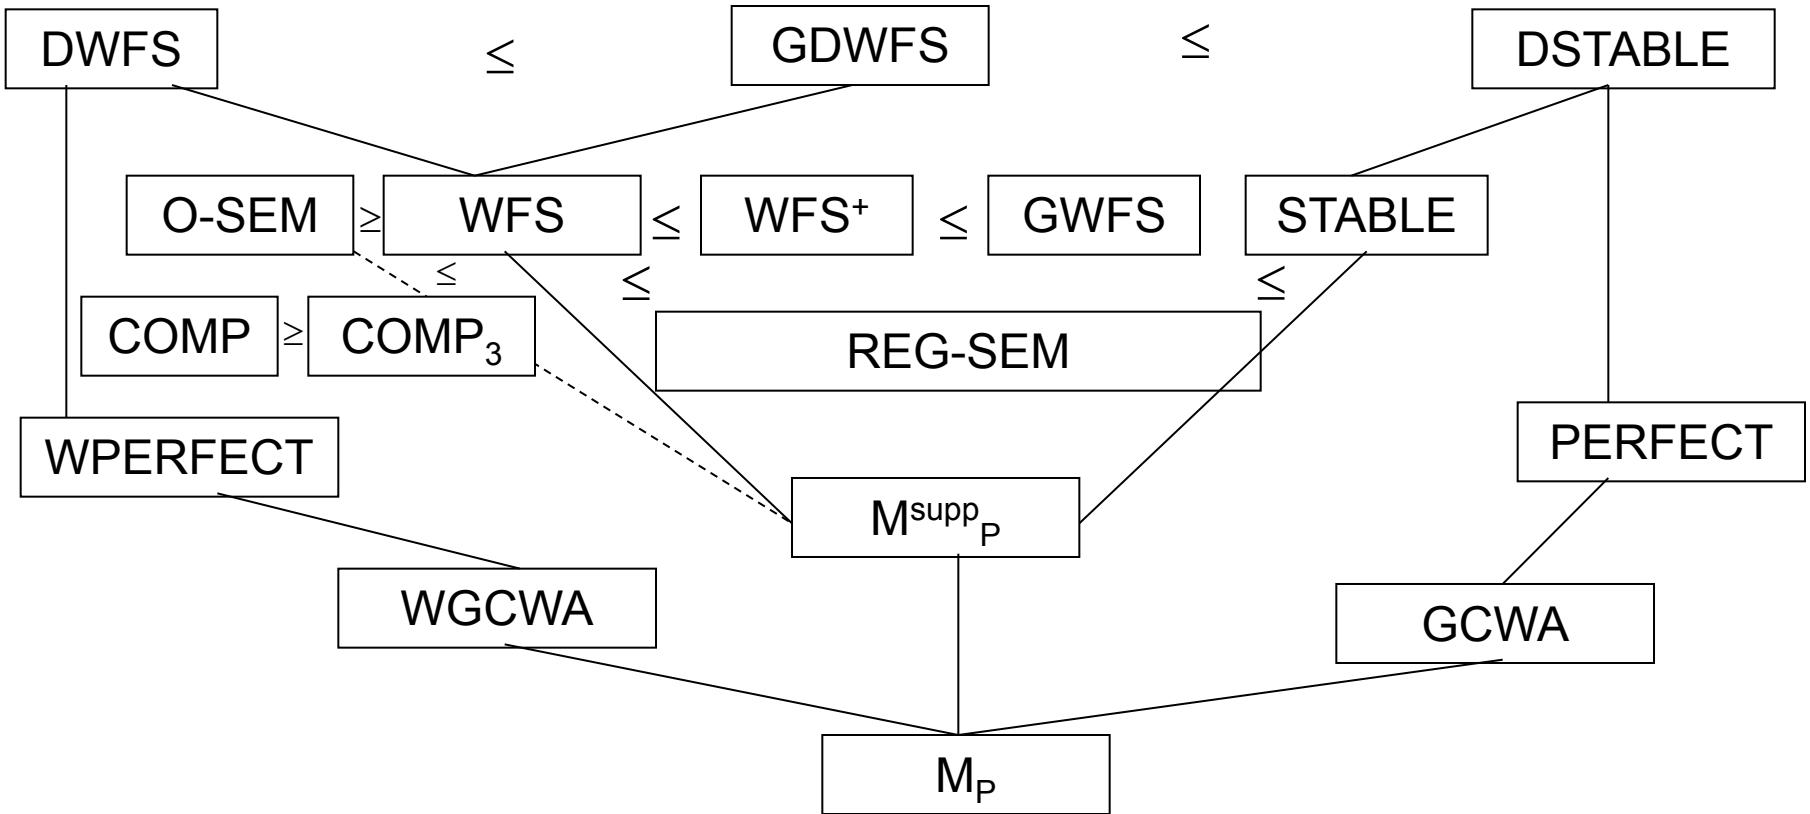

Implementation

(reaction rule
triggered by event
detection)

Example - Semantic LP Profiles

Class	Semantics
Definite LPs	Least Herbrand model: M_p
Stratified LPs	Supported Herbrand model: M_p^{supp}
Normal LPs	Clark's Completion: $COMP$ 3-valued Completion: $COMP_3$ Well-founded Semantics: WFS WFS^+ and WFS' $WFSC$
General Disjunctive	Strong Well-founded Semantics: WFS_E Extended Well-founded Semantics: WFS_S Stable Model Semantics: $STABLE$ Generalized WFS: $GWFS$ $STABLE^+$ $STABLE_C$ $STABLE^{rel}$ Pereira's $O - SEM$ Partial Model Semantics: $PARTIAL$ Regular Semantics: $REG - SEM$ Preferred Semantics: $PREFERRED$ Disjunctive WFS: $DWFS$ Generalized Disjunctive WFS: $GDWFS$
Stratified Disjunctive	Disjunctive Stable: $DSTABLE$ Perfect model $PERFECT$ Weakly Perfect: $WPERFECT$
Positive Disjunctive	Generalized Closed World Assumption: $GCWA$ Weak generalized closed world assumption: $WGCWA$

Semantic Layering - Example LP Semantic Profiles

A semantic SEM' extends a semantic SEM:

SEM' ≥ SEM iff $\forall (P, F) \text{ SEM}(P) \models F \Rightarrow \text{SEM}'(P) \models F$

Semantic Profiles for Evaluation

- A semantics SEM' extends SEM for rule program P iff all formula F which are true in $\text{SEM}(P)$ are also true in $\text{SEM}'(P)$, but in $\text{SEM}'(P)$ more formula can be true or false than with $\text{SEM}(P)$.
- SEM' is defined for a class of programs that strictly includes the class of programs with the semantics SEM
- SEM' coincides with SEM for all programs of the class of programs for which SEM is defined

→ A semantic profile SEM' (= intended evaluation semantics of the inference engine) can be used for all programs (or scoped modules) with $\text{SEM}(P) \leq \text{SEM}'(P)$

Example: Use of Semantic LP Profiles for Interpretation

```
<-- rule interface with two alternative interpretation semantics and a signature.  
The interface references the implementation identified by the corresponding key -->  
<Rule key="#r1">  
  <evaluation index="1">  
    <!-- WFS semantic profile -->  
    <Profile type="&ruleml;Well-Founded-Semantics" />  
  </evaluation>  
  <evaluation index="2">  
    <!-- alternative ASS semantic profile define in the metamodel -->  
    <Profile type="&ruleml;Answer-Set-Semantics" />  
  </evaluation>  
  <!-- the signature defines the queryable head of the backward-reasoning rule -->  
  <signature>  
    <Atom><Rel>likes</Rel><Var mode="+" /><Var mode="-" /></Atom>  
  </signature>  
</Rule>  
  
<!-- implementation of rule 1 which is interpreted either by WFS or by ASS semantics  
and only allows queries according to it's signature definition. -->  
<Rule keyref="#r1" style="reasoning">  
  <if> ... </if>  
  <then>  
    <Atom><Rel>likes</Rel><Var>X</Var><Var>Y</Var></Atom>  
  </then>  
</Rule>
```

Interface
with
evaluation
semantics
and
public rule
signature

Implemen
tation

Example – RIF SWC Profiles

Profile	IRI of the Profile	Model	Satisfiability	Entailment
Simple	http://www.w3.org/ns/entailment/Simple	RIF-Simple-model	satisfiability	RIF-Simple-entailment
RDF	http://www.w3.org/ns/entailment/RDF	RIF-RDF-model	RIF-RDF-satisfiability	RIF-RDF-entailment
RDFS	http://www.w3.org/ns/entailment/RDFS	RIF-RDFS-model	RIF-RDFS-satisfiability	RIF-RDFS-entailment
D	http://www.w3.org/ns/entailment/D	RIF-D-model	RIF-D-satisfiability	RIF-D-entailment
OWL Direct	http://www.w3.org/ns/entailment/OWL-Direct	RIF-OWL Direct-model	RIF-OWL Direct-satisfiability	RIF-OWL Direct-entailment

Simple < RDF < RDFS < D < OWL RDF-Based

Example:

```
<evaluation>
  <Profile type="<&rif;RDFS" iri="http://www.w3.org/ns/entailment/RDFS"/>
</evaluation>
```

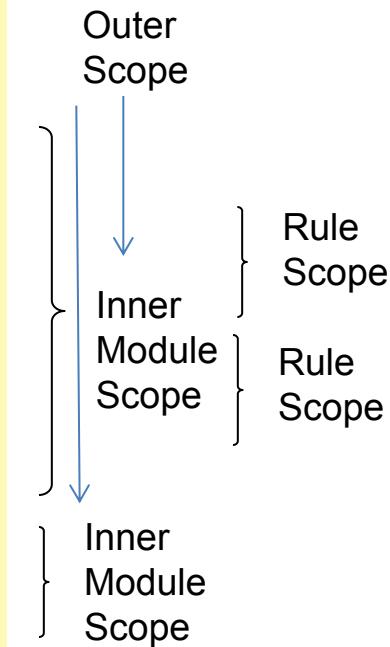

Semantic Profiles in Nested Program Scopes

```
<Assert key="#module1">
  <evaluation><Profile> ...SEM" ... </Profile><evaluation>
```

```
<Rulebase key="#innermodule1.1">
  <evaluation><Profile> ...SEM'... </Profile><evaluation>
    <Rule key="#rule1">
      <evaluation><Profile> ...SEM... </Profile><evaluation>
    </Rule>
    <Rule key="#rule2">
      ...
    </Rule>
  </Rulebase>
```

```
<Rulebase key="#innermodule1.2"> ... </Rulebase>
```

```
</Assert>
```

$$\text{SEM}“(\#module1) \geq \text{SEM}'(\#innermodule1.1) \geq \text{SEM}(\#rule1)$$

$$\text{SEM}(\#rule2) = \text{SEM}“(\#module1)$$

$$\text{SEM}'(\#innermodule1.2) = \text{SEM}“(\#module1)$$

Dynamic Program Views with Scopes and Guards

```
<Assert key="#module1">
  <meta> <!-- descriptive metadata -->
    <Atom><Rel iri="dc:creator"/><Ind>Adrian Paschke</Ind></arg></Atom>
  </meta>
  <qualification> <!-- qualifying metadata -->
    <Atom> <!-- the module is valid for one year from 2011 to 2012 -->
      <Rel>valid</Rel>
      <Interval type="&ruleml;TimeInstant">
        <Time type="&ruleml;TimeInstant"><Data xsi:type="xs:date">2011-01-01</Data></Time>
        <Time type="&ruleml;TimeInstant"><Data xsi:type="xs:date">2012-01-01</Data></Time>
      </Interval>
    </Atom>
  </qualification>
<Rulebase key="#innermodule1.1">
  <!-- the rule base scopes apply to all knowledge in the rule base -->
  <scope> <!-- scope : only knowledge authored by „Adrian Paschke“ -->
    <Atom><Rel iri="dc:creator"/><Ind>Adrian Paschke</Ind></arg></Atom>
  </scope>
  <scope> <!-- scope : only valid knowledge; validity value will be bound to variable -->
    <Atom><Rel>valid</Rel><Var>Validity</Var></Atom>
  </scope>
  <Rule key="#rule1">
    <scope> <Atom><Rel>source</Rel><Ind>./module1.prova</Ind></Atom></scope>
    <guard> <!-- guard on the validity: “current date during validity of module1”>
      <Operator type="&ruleml;During"><Expr iri="...getDate()"/><Var>Validity</Var></Operator>
    </guard>
    <if> ... </if> <then>  </then>
  </Rule>
</Rulebase>
</Assert>
```

Outer Scope

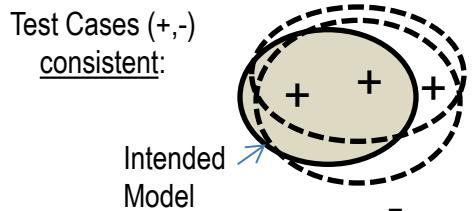

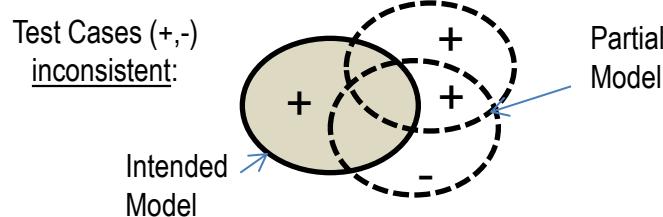

Inner Scope + Guard

Note: Local functions are interpreted with the intended semantics of the scope

Test Cases for Self-validating Rule Bases

- Test Cases constrain the possible models and **approximate the intended models** of the rule base

- **Queries** are used to test the rule base

- A test case is defined by $T := \{X, A, N\}$, where
 - $X \subseteq L$ assertion base (input data, e.g. facts)
 - $A \in L$ a formula denoting a test query
 - $N := +, -$ a positive or negative label

- Semantics

$$M_0 \models_{TC} (X, A, +) \text{ iff } \forall m \in M_0 : m \in \sum(\text{Mod}(X), R) \Rightarrow m \in \text{Mod}(A)$$

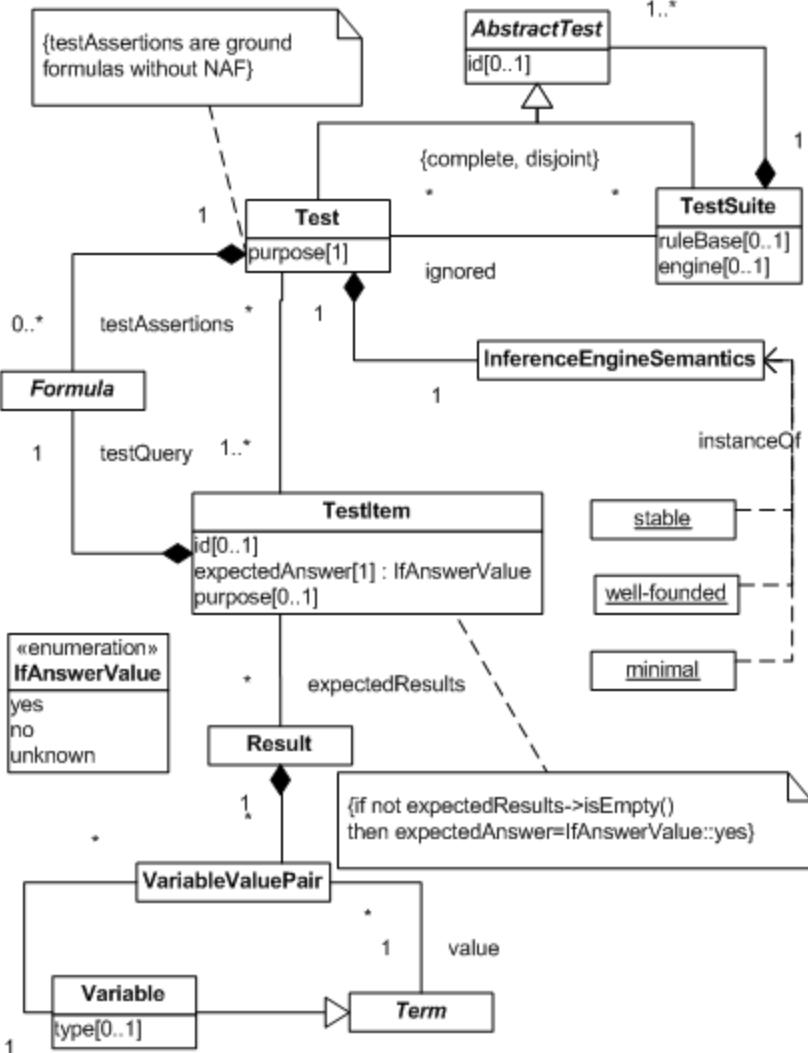

$$M_0 \models_{TC} (X, A, -) \text{ iff } \exists m \in M_0 : m \in \sum(\text{Mod}(X), R) \Rightarrow m \notin \text{Mod}(A)$$

- \models_{TC} compatibility relation
- Mod association function between sets of formulas and sets of models
- Σ model selection function

$$A \notin C_R(X) \text{ for } T := \{X, A, +\} \text{ and } A \in C_R(X) \text{ for } T := \{X, A, -\}$$

- $C_R(X)$ deductive closure of X . Decidable inference operator based on formal proofs

Rule Markup for Test Cases / Test Suites

```

<TestSuite ruleBase="SampleBase.xml">
  <Test id="ID001" purpose="...">
    <Assert><formula>
      <And>
        <Atom>
          <Rel>parent</Rel>
          <Ind>John</Ind>
          <Ind>Mary</Ind>
        </Atom>
      </And>
    </formula></Assert>
    <TestItem expectedAnswer="yes">
      <Query><formula>
        <Atom closure="universal">
          <Rel>uncle</Rel>
          <Ind>Mary</Ind>
          <Var>Nephew</Var>
        </Atom>
      </formula></Query>
      <expectedResults>
        <VariableValuePair>
          <Var>Nephew</Var>
          <Ind>Tom</Ind>
        </VariableValuePair>
        <VariableValuePair>
          <Var>Nephew</Var>
          <Ind>Irene</Ind>
        </VariableValuePair>
      </expectedResults>
    </TestItem>
    <InferenceEngineSemantics><Profile
      ="\&ruleML;MinimalHerbrandSemantics"/></InferenceEngineSemantics>
  </Test></TestSuite>

```

Testing Semantic Properties

- Entailment Tests for Classical Logics
 - *right weakening, reflexivity, and, or, left logical equivalence, cautious monotony, cut, rationality, negation rat., disjunction rat., ...*
- Entailment Tests for Skeptical Logics
 - *cumulativity, rationality, ...*
- Weak Semantic Properties Tests
 - *elimination of tautologies, generalized principle of partial evaluation, positive/negative reduction, elimination of non-minimal rules, independence, relevance, ...*

Example – Cautious Montony Test

P: $a \leftarrow \text{not } b$
 $b \leftarrow \text{not } a$
 $c \leftarrow \text{not } c$
 $c \leftarrow a$

$P' : a \leftarrow \text{not } b$
 $b \leftarrow \text{not } a$
 $c \leftarrow \text{not } c$
 $c \leftarrow a$
 c

T: { $a \Rightarrow \text{true}$, $c \Rightarrow \text{true}$ }

- $\text{STABLE}(P) \models_{\text{TC}} \{a, \text{not } b, c\}$, i.e. T succeeds.
- $\text{STABLE}(P') \models_{\text{TC}} \{\text{not } a, b, c\}$, i.e. T fails.

→ Test Case: STABLE does not cautious monotony

Agenda

- Reaction RuleML
- Semantic Profiles
- Semantic Metamodel and External Ontologies (Semantic Sorts)
- Syntactic Customization

RuleML Types (Sorted Logic)

- Types (sorts) can be assigned by using the **@type** attribute
- External vocabularies / ontologies define types, e.g.,

```
<Var type="&vo;Vehicle">Car</Var>  
<Ind iri="&vo;Corolla" type="&vo;Sedan"/>
```
- Semantics defined / linked by Semantic Profile, e.g. order-sorted logic using RDFS or OWL entailment profiles

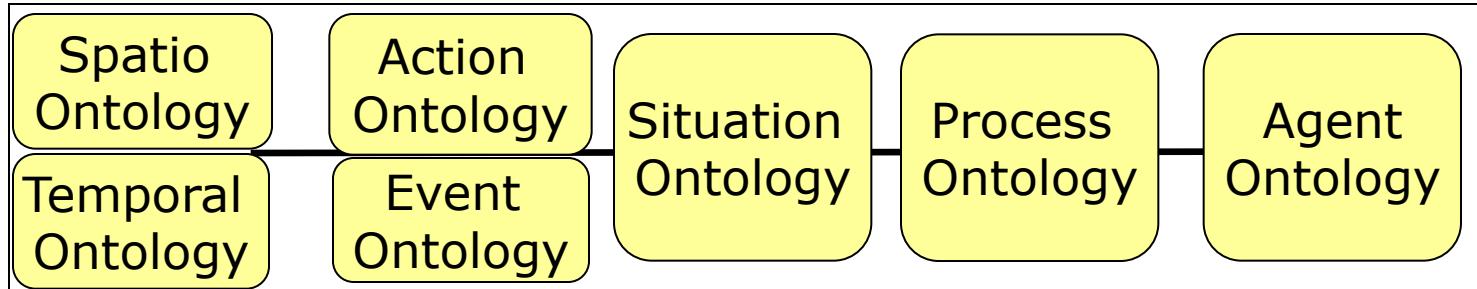

Reaction RuleML Examples with Types from RuleML Metamodel and External Ontologies

```
<Quantifier type="&ruleml;Forall"> == <Forall>
<Operator type="&ruleml;And"> == <And>
<Operator type="&ruleml;Conjunction"> == <Conjunction>
<Negation type="&ruleml;InflationaryNegation"> == <Naf>
<Action type="&ruleml;Assert"> == <Assert>
<Action type="&ruleml;Retract"> == <Retract>
<Event type="&ruleml;SimpleEvent"> == <Atom> ... </Atom>
<Event type="ibm:CommonBaseEvent"> == IBM CBE
<Operator type="snoop:Squence"> == Snoop Algebra
  == <Operator type="&ruleml;Sequence"> == <Sequence>
<Ind iri="person.xml#xpointer("//Person/LastName[1]/text())"/>
<Action iri="BPEL.xml#xpointer("//invoke[@name=checkHotel])"/>
```

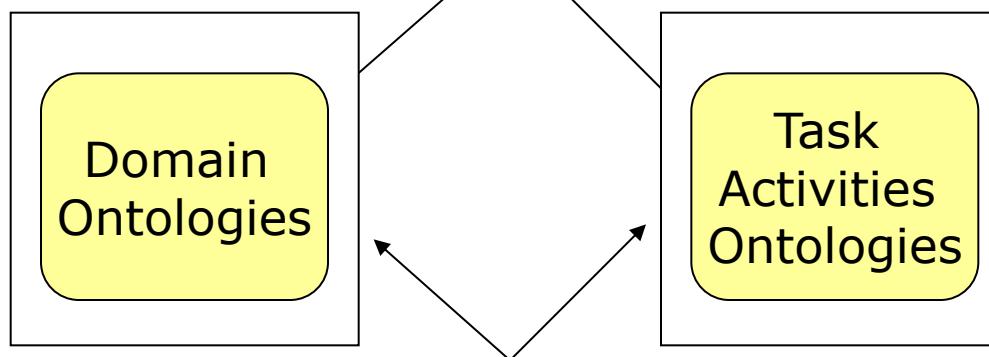

Reaction RuleML Metamodel

Top Level Ontologies

General concepts such as space, time, event, action and their properties and relations

Vocabularies **related to specific domains** by specializing the concepts introduced in the top-level ontology

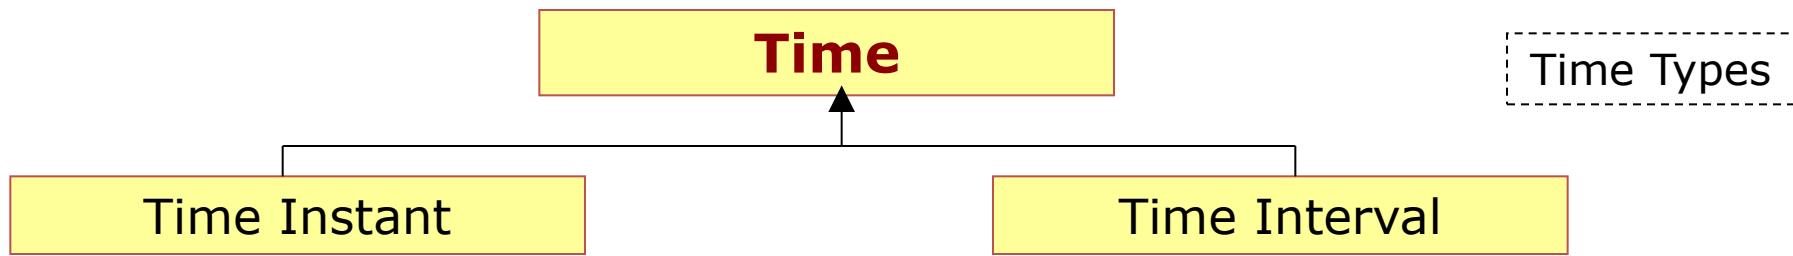

Vocabularies **related to generic tasks or activities** by specializing the concepts introduced in the top-level ontology

Specific
user/application
ontologies

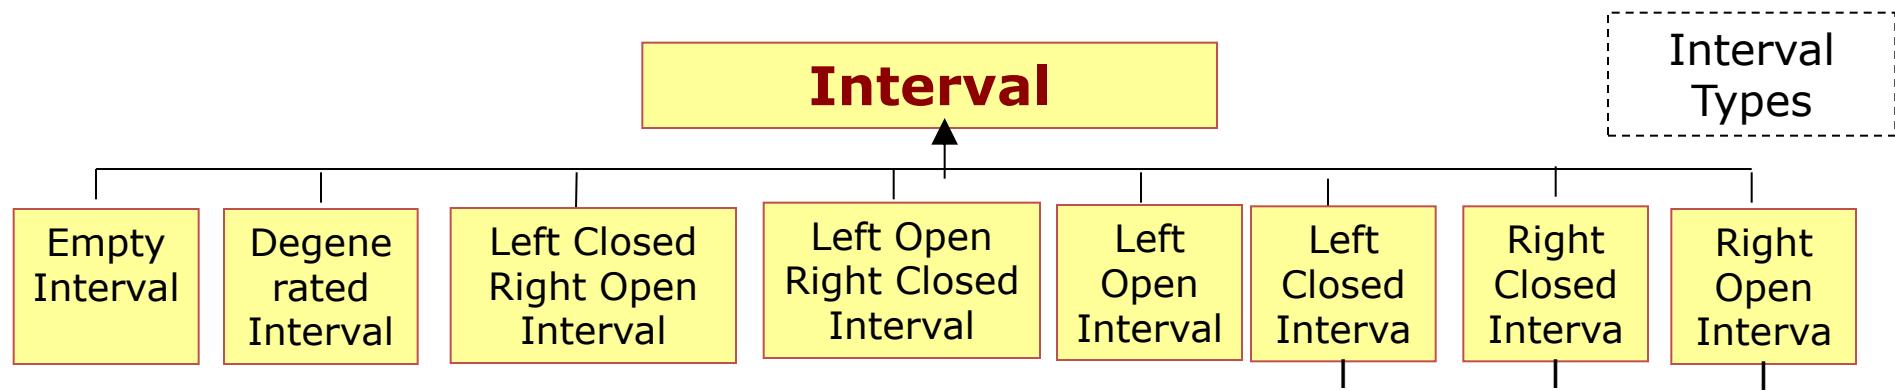

E.g. ontologies describing roles played by domain entities while performing application activities

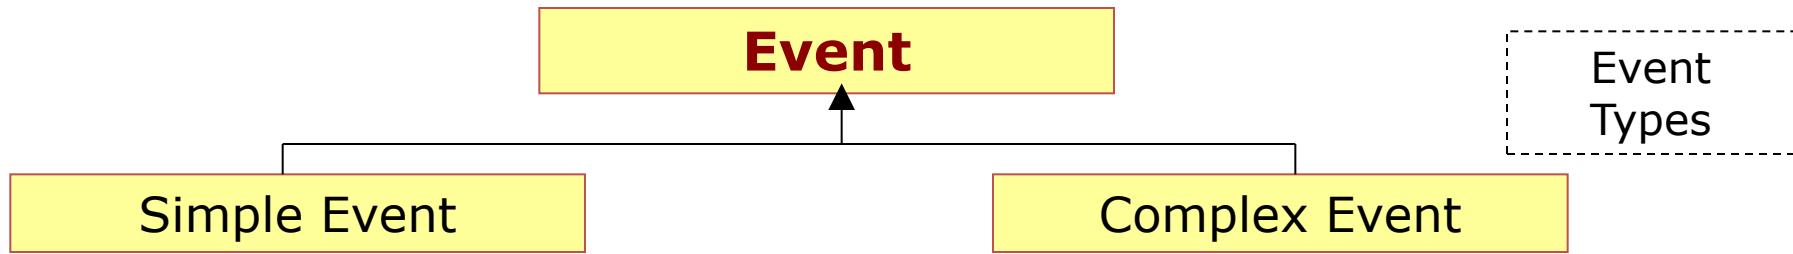

Time Top Ontology Metamodel

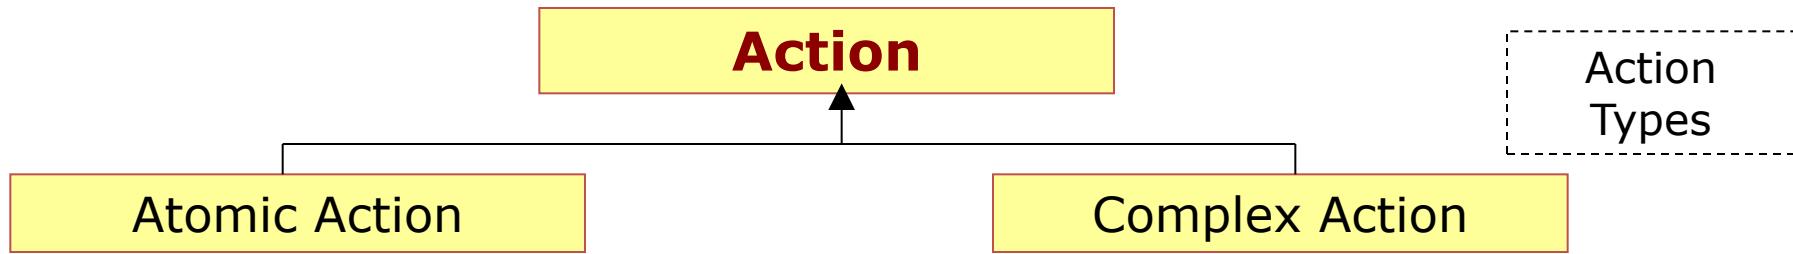

Interval Top Ontology Metamodel

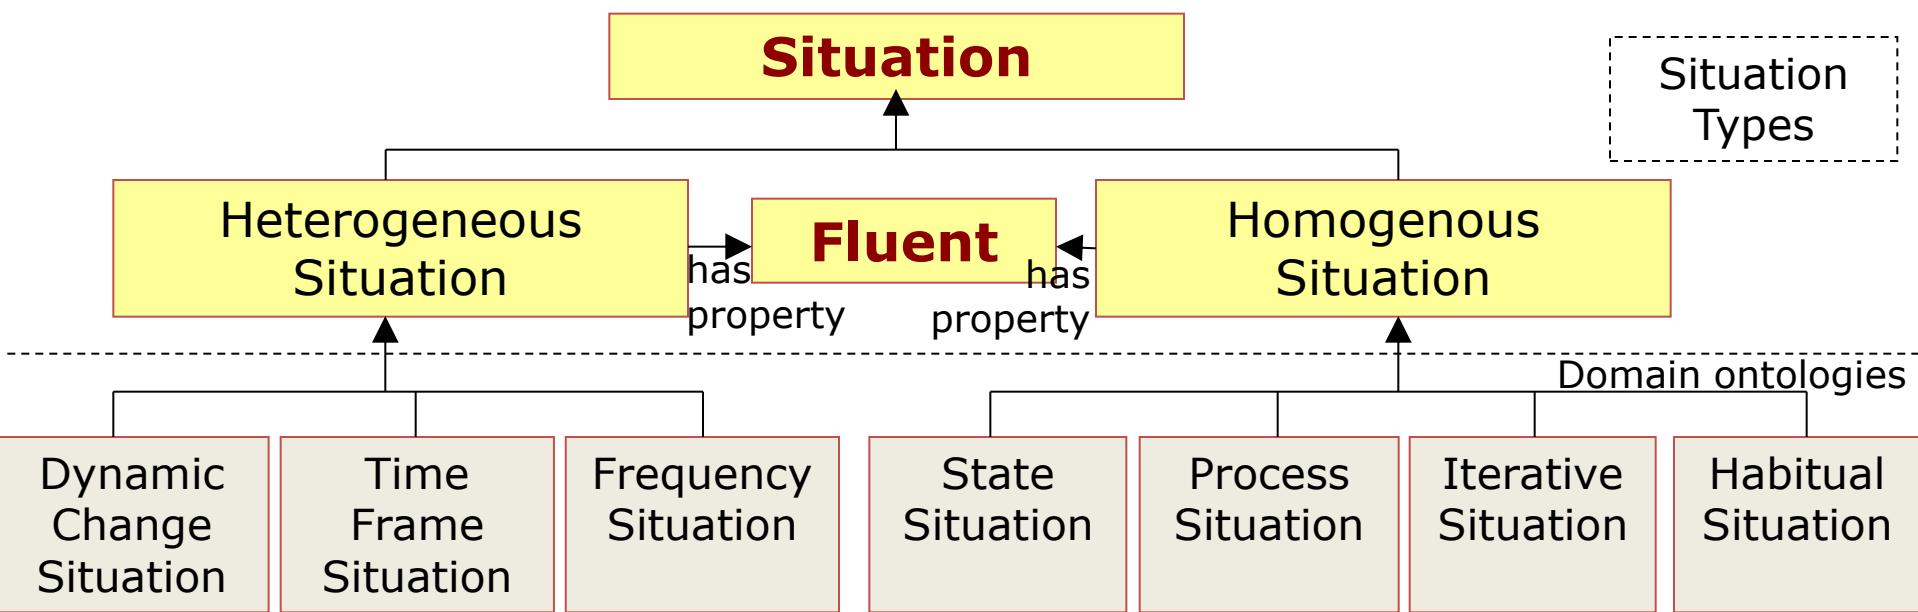

Event Top Ontology Metamodel

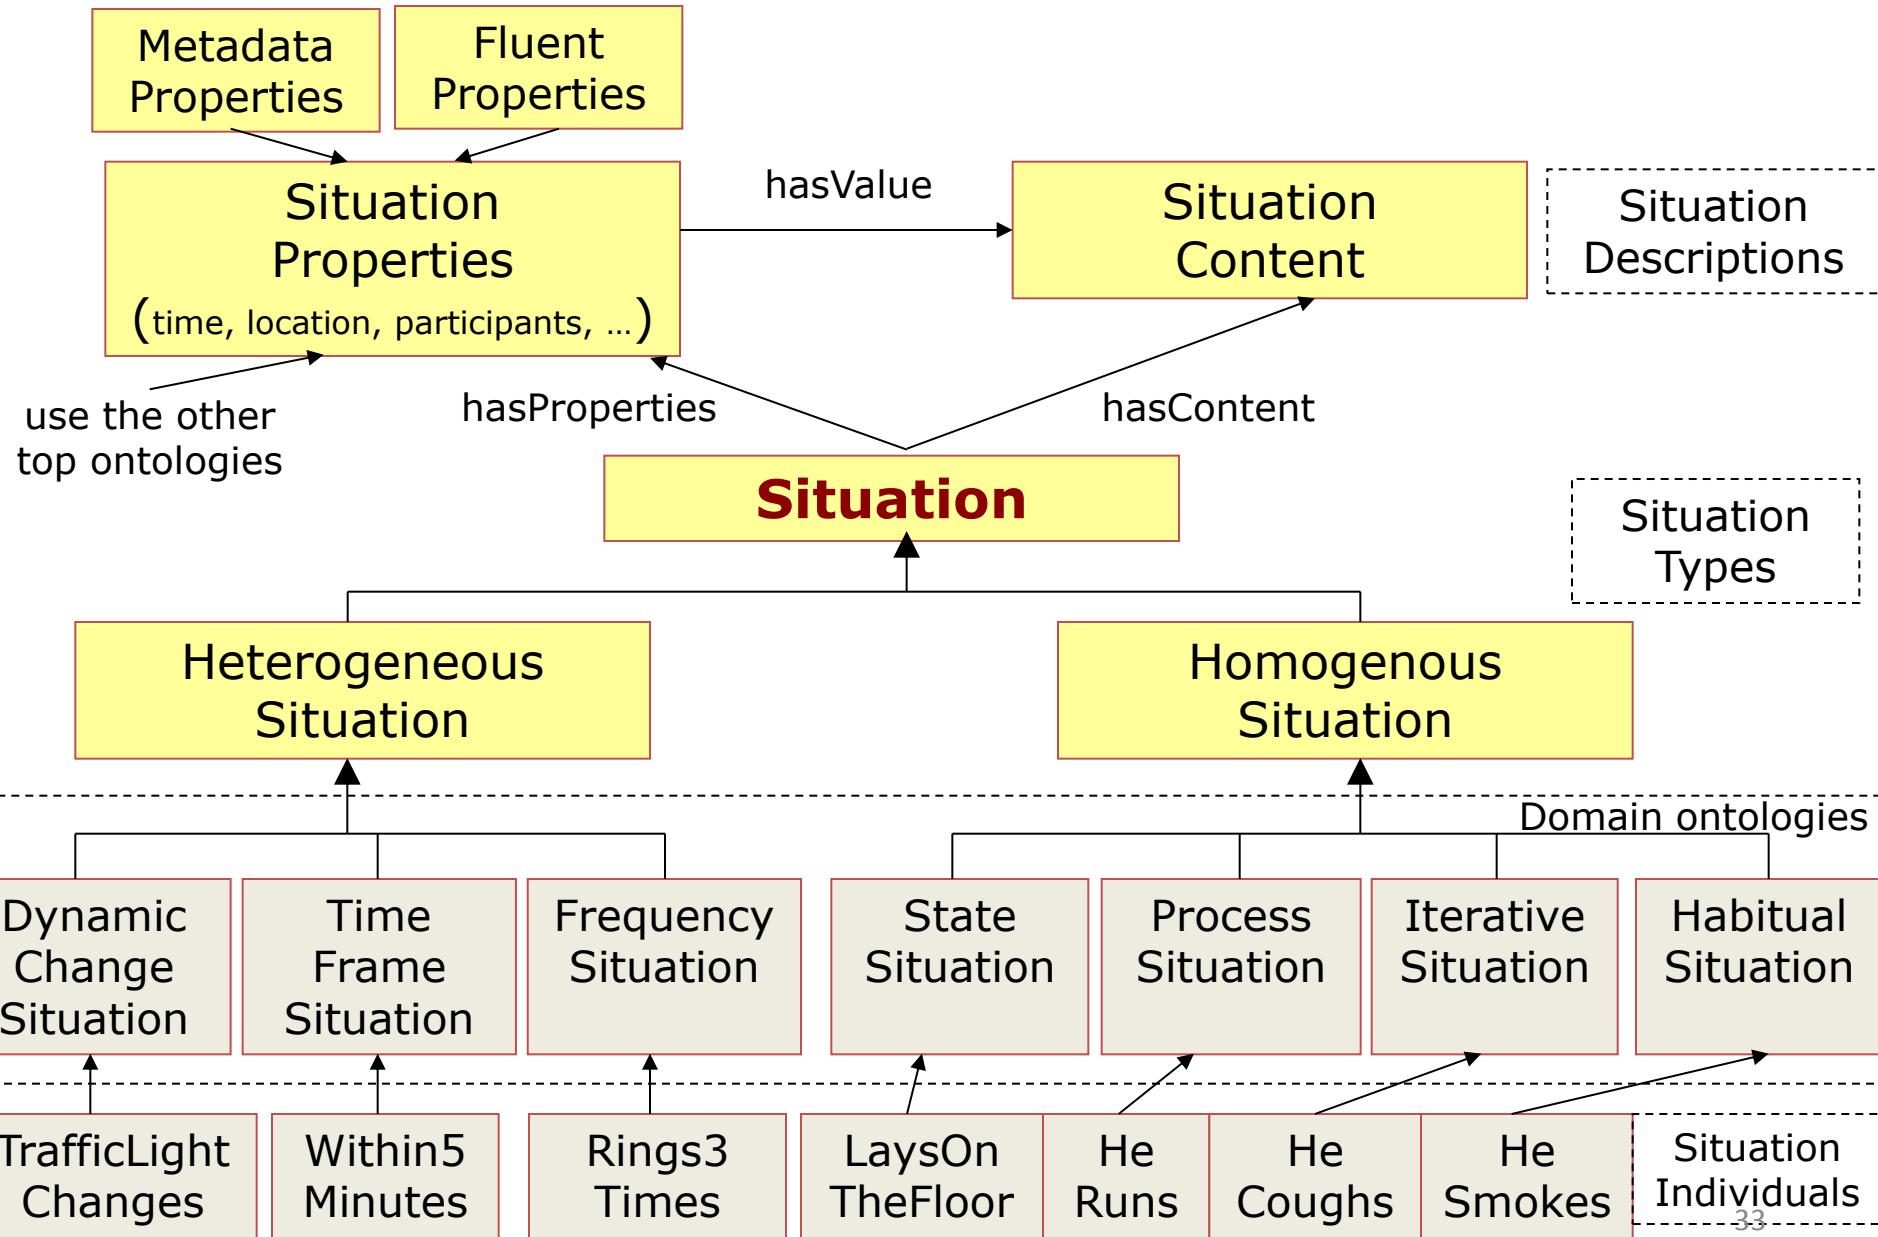

Action Top Ontology Metamodel

Situation Top Ontology Metamodel

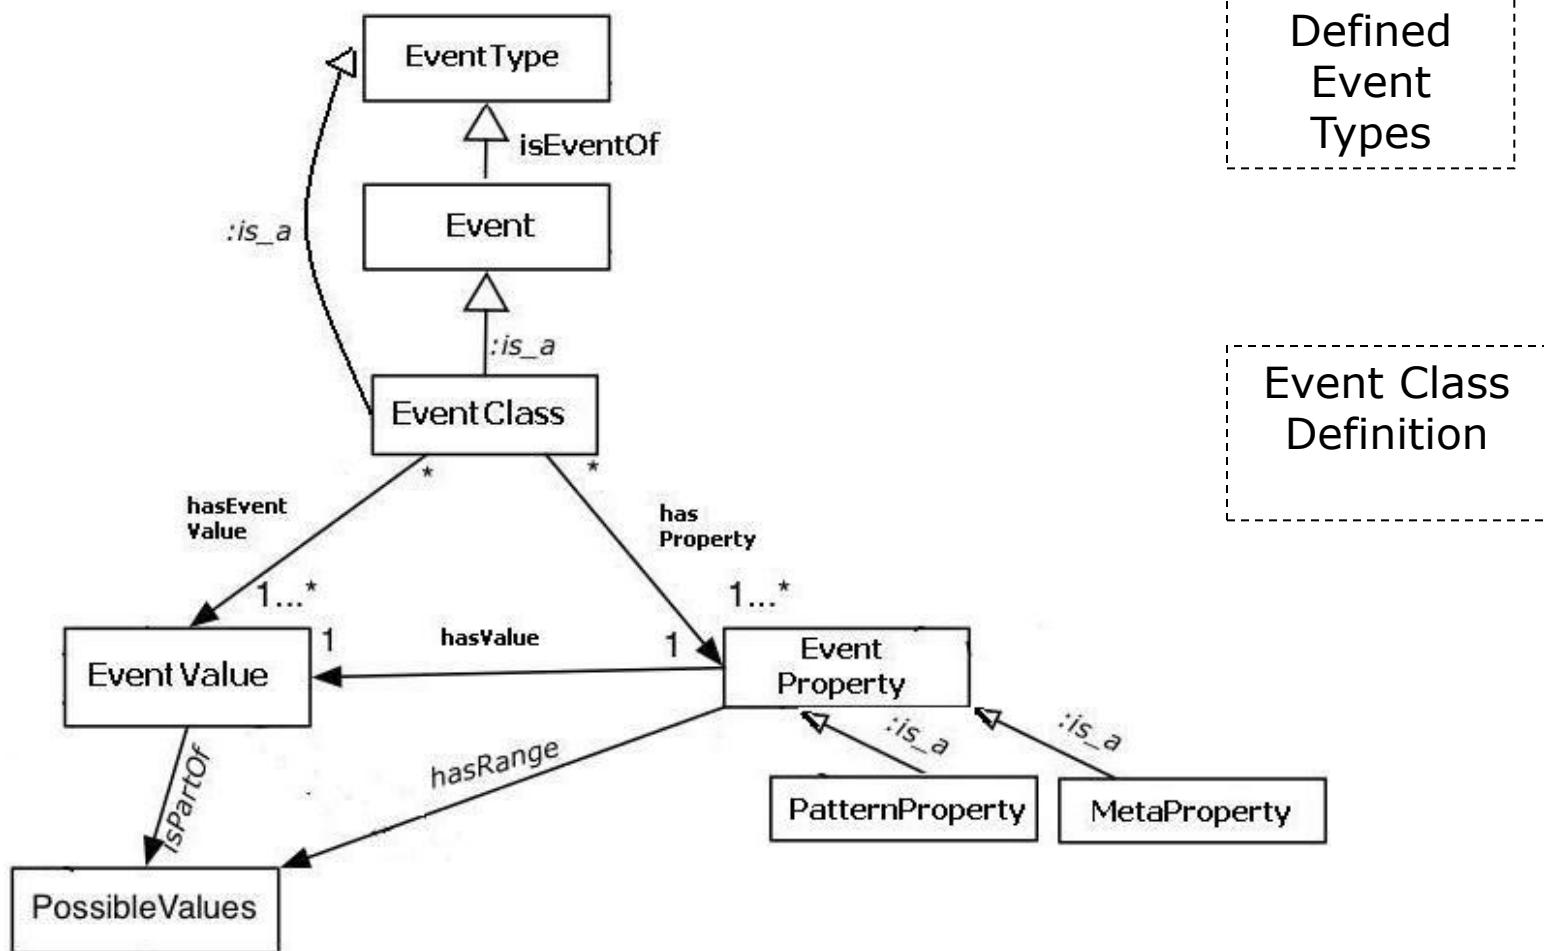

Example: Situation Top Ontology Metamodel

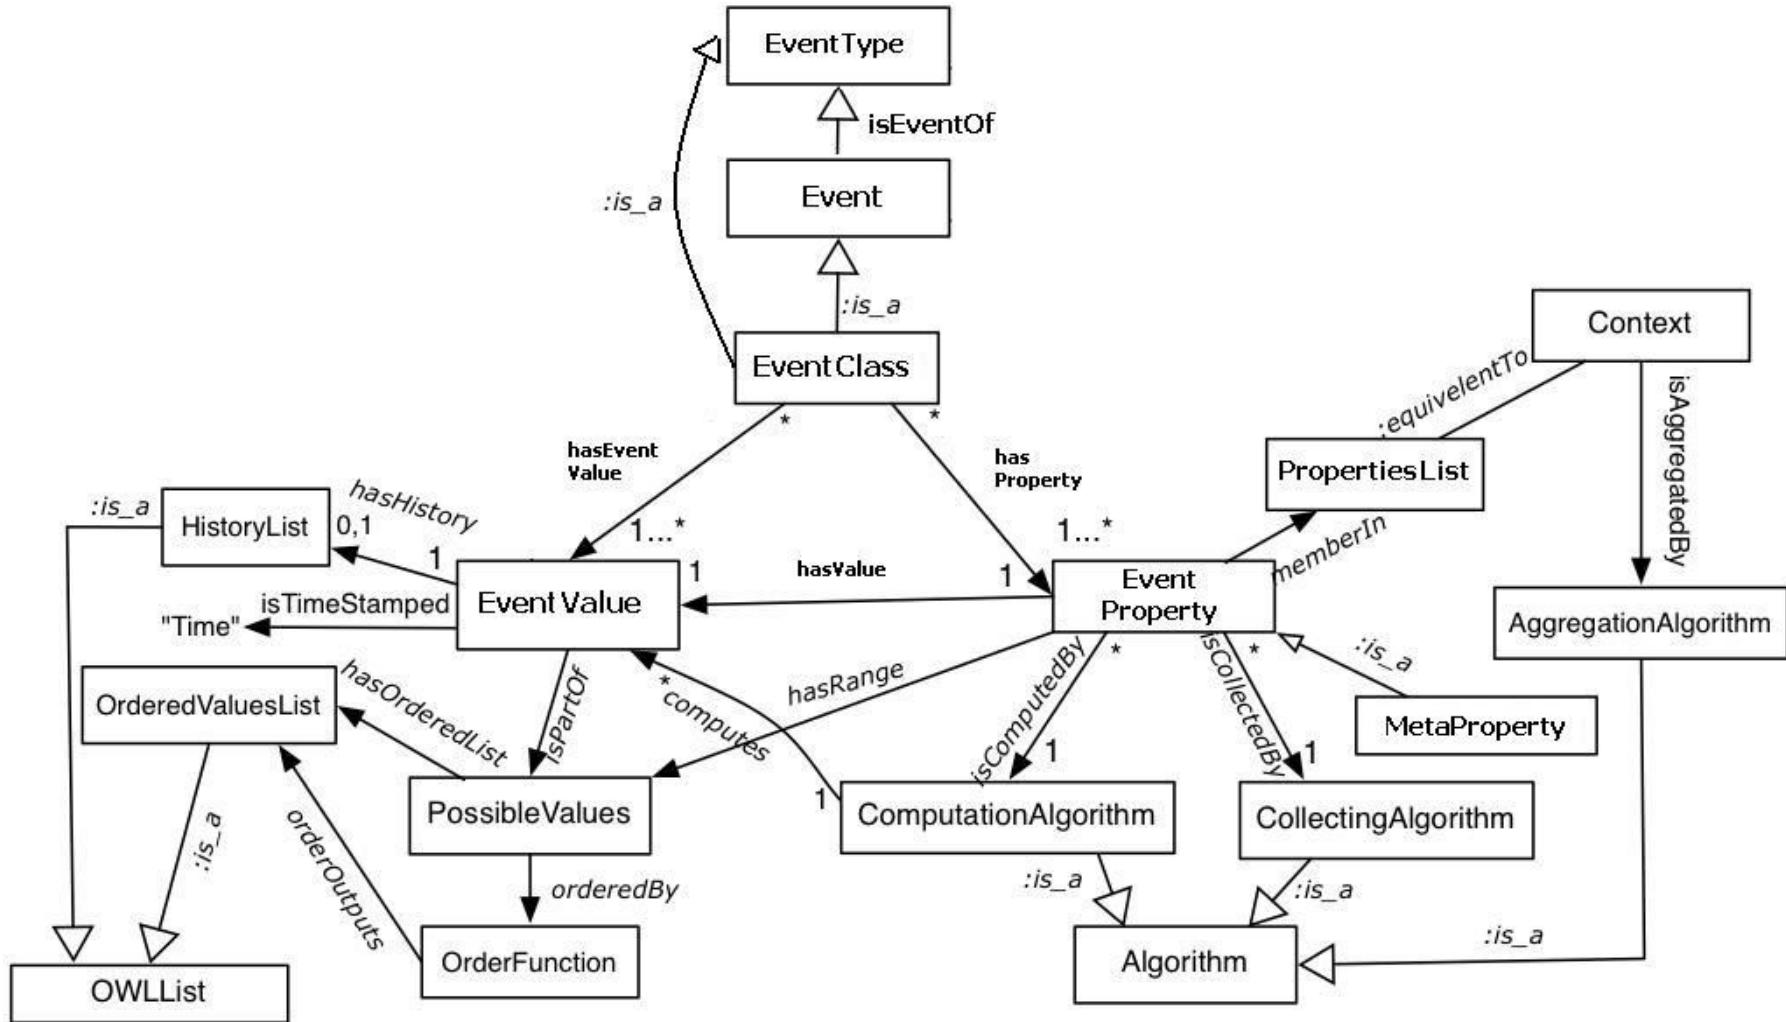

Example - Event MetaModel

(for defining Event Types as Instances of the MetaModel Event Class)

Extended Event Meta Model Ontology

(with computational properties and complex value definitions)

Example - Typed Complex Event **Pattern** Definition

```
<Event key="#ce2" type="&ruleml;ComplexEvent">
  <signature> <!-- pattern signature definition -->
    <Sequence>
      <signature>
        <Event type="&ruleml;SimpleEvent">
          <signature><Event>...event_A...</Event></signature>
        </Event>
      </signature>
      <signature><Event type="&ruleml;ComplexEvent" keyref="ce1"/></signature>
      <signature>
        <Event type="cbe:CommonBaseEvent" iri="cbe.xml#xpointer(/CommonBaseEvent)" />
      </signature>
    </Sequence>
  </signature>
</Event>

<Event key="#ce1">
  <signature> <!-- event pattern signature -->
    <Concurrent>
      <Event><meta><Time>...t3</Time></meta><signature>...event_B</signature></Event>
      <Event><meta><Time>...t3</Time></meta><signature>...event_C</signature></Event>
    </Concurrent>
  </signature>

Example

ECA and CEP RuleML Expressiveness Layering

Summary

- Fine grained **syntactic language configuration** (expressiveness) with MYNG (as Relax NG schemas)
- Intended semantics defined by **Semantic Profiles**
 - **Semantic Test Cases** for verification and validation
- Sorted Logic supports **Types** defined in external semantic ontologies and Meta Model vocabulary
- Towards joint standards for Deliberation, Reaction Rules
