

IC Ontology and Controlled Vocabulary (O/CV) Framework

Spatial Ontology Community of Practice Workshop

November 12, 2009

Dr. Leo Obrst

MITRE

Information Semantics Group

Information Discovery & Understanding

Command and Control Center

Agenda

- **IC O/CV Program Overview**
- **Framework FAQ**
- **Target Capabilities**
- **Roadmap**

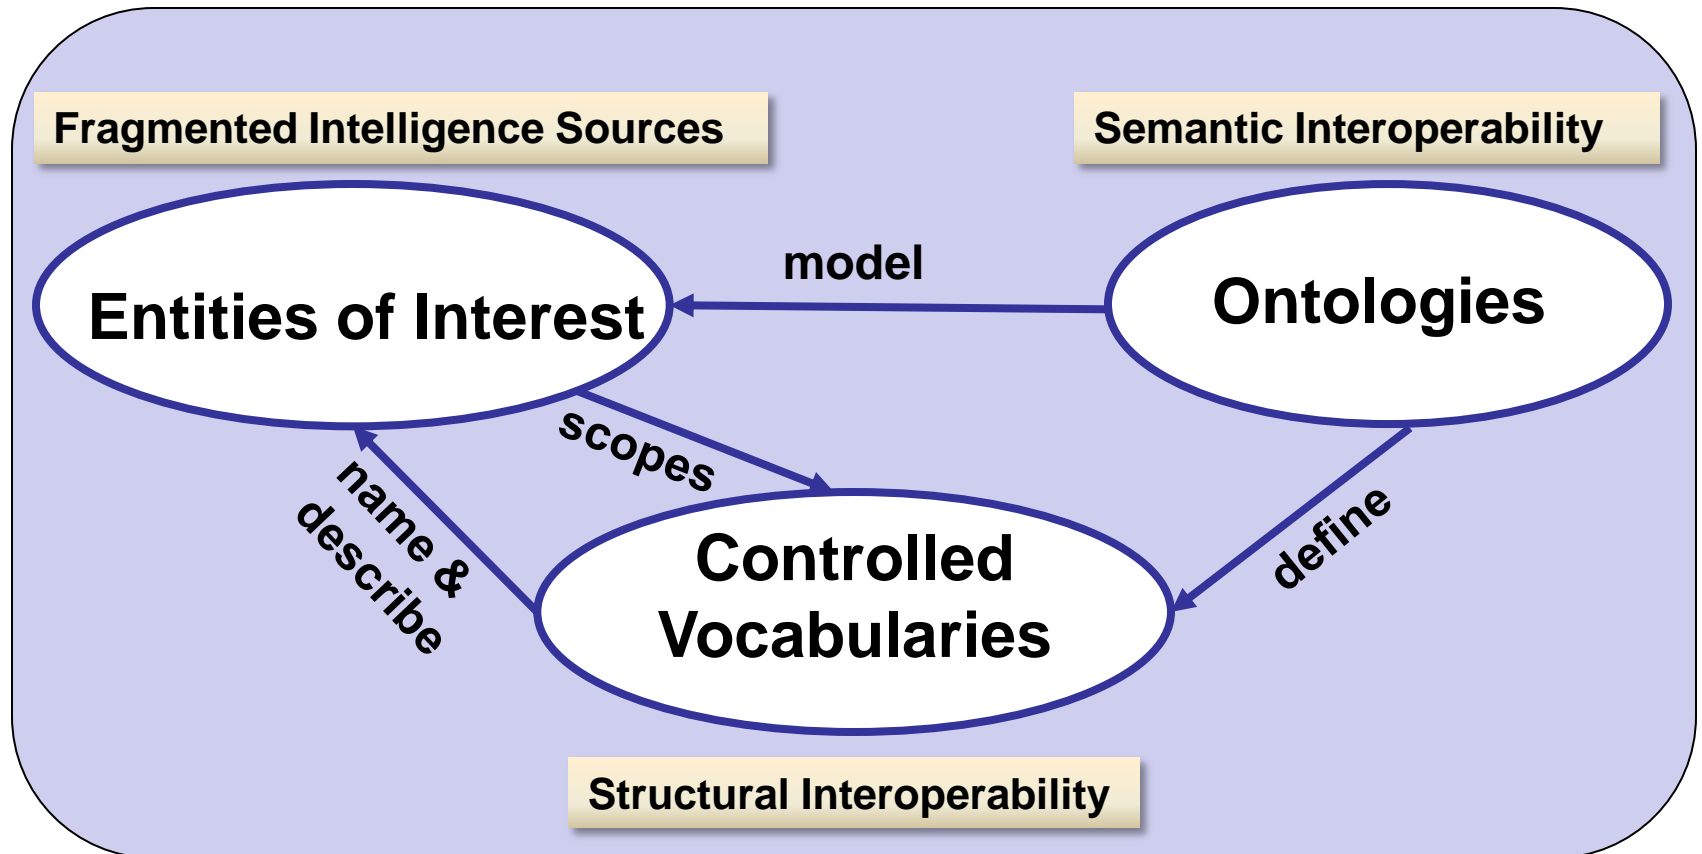

IC O/CV Program Overview

- **Who:** Team of MITRE engineers sponsored by IC CIO to provide guidance for IC-wide collaborative ontology and controlled vocabulary (O/CV) development, management and implementation

- **What/When**
 - **Phase 1-2008**
 - Assess the current IC ontology and CV development and management capabilities and gather requirements for target capabilities
 - Develop a framework that estimates target capabilities and provides guidance for achieving them
 - **Future Phases – 2009+**
 - Refine Framework
 - Support implementation

- **Why:** To rapidly and continuously improve the semantic and structural interoperability of IC information, including legacy information from disparate sources

What is Semantic and Structural Interoperability?

IC O/CV Framework FAQs

- 1. What is the IC Ontology and Controlled Vocabulary Framework?**
 - The framework is an end-to-end approach for the collaborative development, management, governance and implementation of ontologies and controlled vocabularies across the IC enterprise.
 - Defines target capability, processes, principles and best practices
- 2. How does the intelligence analyst benefit?**
 - Improved enterprise information sharing and exchange capability
 - preserves context of information from disparate sources
 - improves information retrieval and discovery capabilities
 - enables intelligent information aggregation and visualization
 - Improved advanced analytic capabilities such as
 - entity correlation and disambiguation
 - link analysis capability
 - predictive analysis

IC O/CV Framework FAQs

3. How does the IC enterprise benefit?

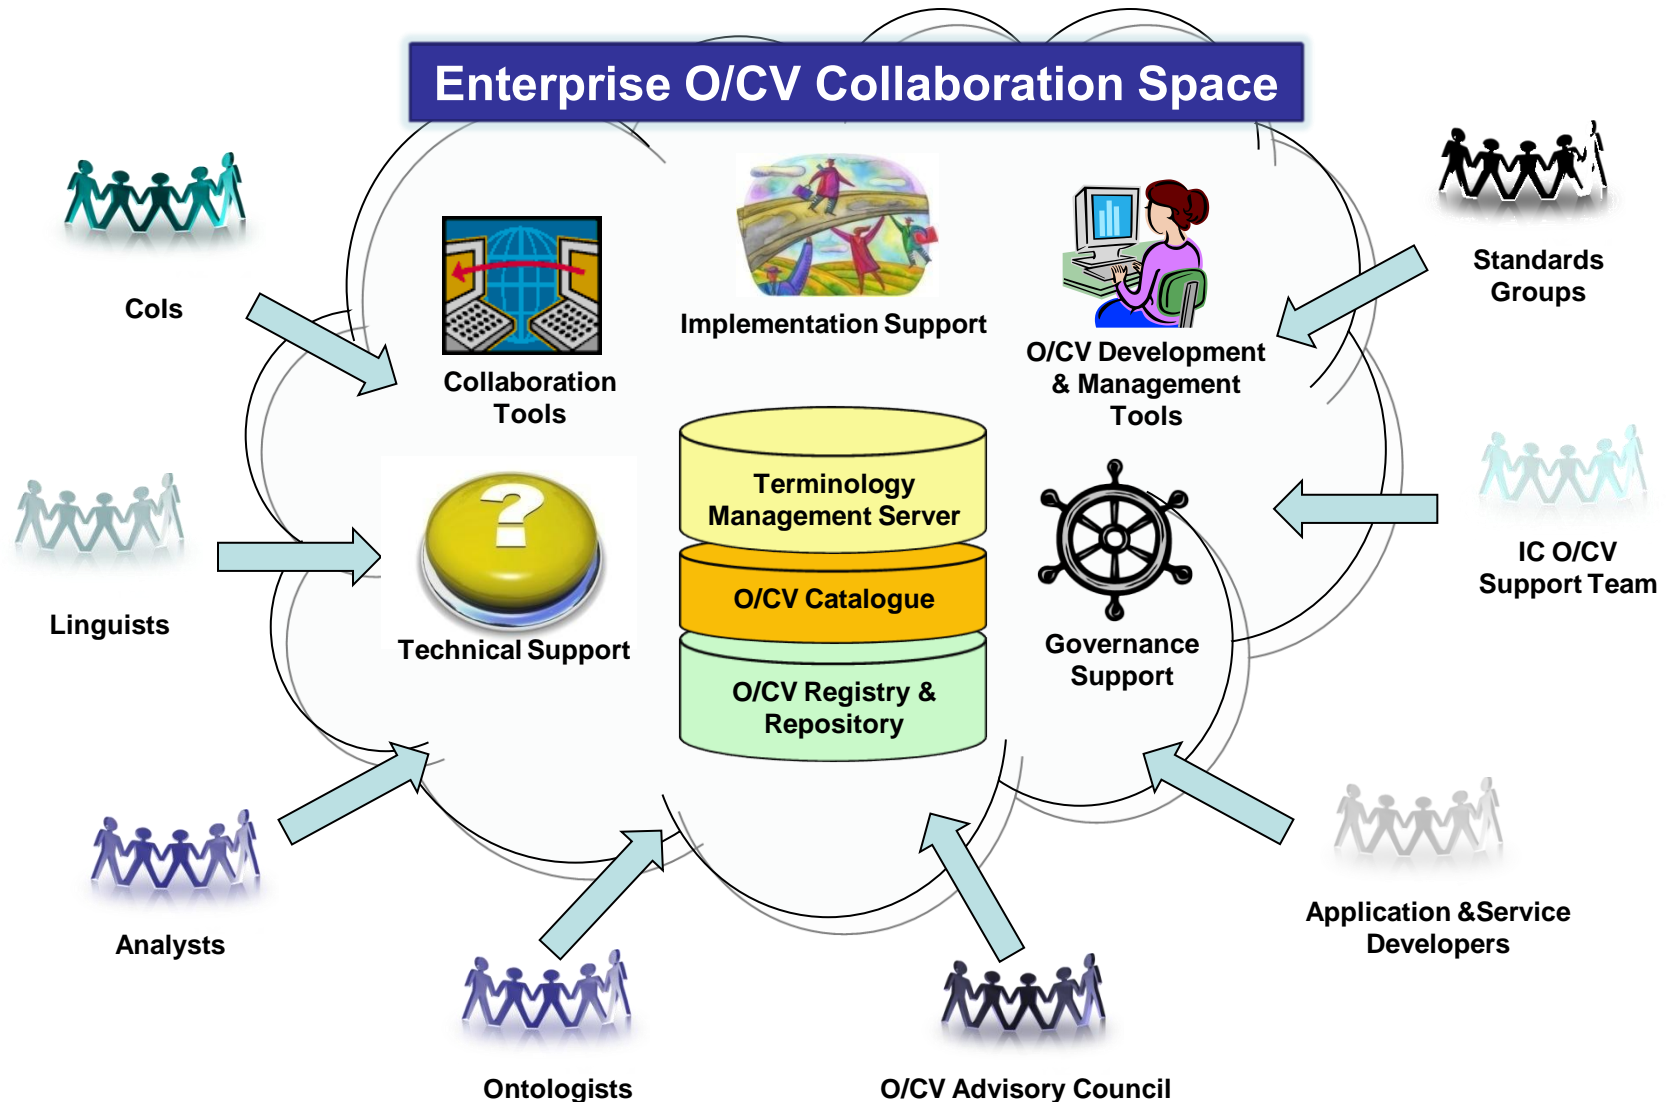

- Provides continuous, measurable improvement of information sharing and analytic capability
- Supports centralized planning and rapid, distributed execution via communities of interest (Col)
- Addresses enterprise-scale information sharing challenges at the enterprise level such as
 - cross-domain information assurance
 - enterprise standards support
 - mediation of formal data sharing agreements
- Builds trust through the establishment of a community of communities
- Promotes transparency and reduces waste by managing ontologies and controlled vocabularies as enterprise assets
 - reduces wasted time and money on agency-specific solutions to enterprise-scale problems
 - reduces inefficiency, redundancy, and rework associated with O/CV development and implementation
 - makes enterprise semantics continuously more explicit and transparent

IC O/CV Framework FAQs

4. How does O/CV developers and implementers benefit?

- **Enterprise-level infrastructure**
 - collaboration space and tools enable collaborative development and IC O/CV transparency
 - enables the IC to concentrate on developing and implementing ontologies and controlled vocabularies rather than building the infrastructure to support them
 - builds an enterprise library of high quality ontologies and controlled vocabularies for repurposing and reuse
- **Enterprise-level O/CV Technical Support**
 - improves the quality and reusability of ontologies and controlled vocabularies
 - provides the technical guidance that ensures practical use and reuse through consistent development and implementation
- **Governance**
 - provides a venue to resolve the challenges, which will enable enterprise-wide information sharing
 - provides enterprise-level guidance for implementing information sharing solutions
