

User Interface

- Applications having semantic wiki spirit but not called “wiki”:
Google Docs, Intranet-aware OpenOffice, Microsoft SharePoint
- No more wiki text syntax for normal users
Alternatives: WYSIWYGM XHTML+RDFa editing, Semantic Forms

Knowledge Representation and Reasoning

- Adequately mapping complex knowledge structures onto *page*-granular wiki architecture (\leadsto *deep annotation, refactoring, ... ?*)
(So far: *page* = base unit of editing, versioning, linking, search)
- more expressive reasoning vs. maintaining consistency
(Identified as a challenge years ago, but not too many results yet!)
